Mesenchymal Stromal Cells Peiman Hematti, Armand Keating, 2013-01-16 Mesenchymal Stromal Cell MSC biology has been studied for more than 4 decades and the cells have been investigated for potential clinical applications for more than 15 years. Progress has become exponential over the past decade due mainly to the broad therapeutic potential of these cells. However, MSC studies have also been subject to controversy and increasing scrutiny as new mechanisms of action are reported and ever-expanding therapeutic applications pursued. In this book, leading authorities from all over the world who are actively involved in this field provide state-of-the-art knowledge of the basic biology, translational requirements, and latest clinical experience with MSCs. This cutting-edge book is the ideal resource for scientists and clinicians interested in pursuing an important and rapidly developing field of research that will eventually help patients and address urgent unmet medical needs. Features include: Coverage of the biology of MSCs; latest understanding of mechanisms of action and role in tissue homeostasis and regeneration; Identifying the potential of MSCs in proceeding from bench to bedside; from regulatory GMP production; ethical and safety aspects; Critical analysis of clinical studies and the potential of MSCs to treat a wide variety of human diseases and tissues.

Anthropology and Cryptozoology Samantha Hurn, 2016-11-03 Cryptozoology is best understood as the study of animals which in the eyes of Western science are extinct, unclassified, or unrecognised. In consequence and in part because of its selective methods and lack of epistemological rigour, cryptozoology is often dismissed as a pseudo-science. However, there is a growing recognition that social science can benefit from engaging with it, for as social scientists are very well aware, scientific categorisation and explanation represents just one of a myriad of systems used by humans to enable them to classify and make sense of the world around them. In many cultural contexts, myth, folk classification, and lived experience challenge the truth expounded by scientists. With a reflexive anthropological approach and drawing on rich empirical and ethnographic studies from around the world, this volume engages with the theoretical and methodological issues raised by reported sightings of unrecognised animals. Bringing into sharp focus the anthropological value and challenges for methodology posed by beliefs about unclassified creatures, *Anthropology and Cryptozoology* explores encounters with mysterious creatures, which will be of interest to anthropologists, sociologists, and geographers working in the fields of research methods, anthrozoology, mythology, and folklore, and human-animal interaction.

Pseudomonas Aeruginosa, Biology, Genetics, and Host-pathogen Interactions Dara W. Frank, 2012-02-02 The opportunistic pathogen *Pseudomonas aeruginosa* offers a rich variety of biologically relevant topics to explore and serves as a model system to understand the interactions of Gram-negative bacteria with human hosts. The organism adapts readily to most environments. It has a large and variable genome with a great deal of metabolic potential. *P. aeruginosa* encodes a variety of regulatory systems to fine-tune gene expression and integrate environmental signals. This organism can infect both plants and animals and produces a plethora of enzymes and factors that can overcome host defenses. Moreover, it has the ability to change

between the states of a sedentary colonizer to an invasive and highly motile organism Clinically the bacterium is resistant to many antibiotics making it difficult to treat and impossible to eradicate from the lungs of patients with cystic fibrosis Intrinsic antibiotic resistance combined with an armamentarium of tissue degradative enzymes makes it imperative to possess a comprehensive understanding of the biology genetics and pathogenesis of this organism so that novel therapeutics based on virulence product neutralization can be designed and implemented This Research Topics issue will be devoted to updating the current understanding of *P. aeruginosa* systems as they relate to its different lifestyles in different environments The underlying theme is to provide broad overviews and to integrate protein structure function and gene regulation as it relates to the biology of this bacterium

The biology and ecology of ticks shape the potential for the transmission of zoonotic pathogens. Agustín Estrada-Peña, Jose De La Fuente, 2015-02-24 Ticks are noticeable by the high diversity of pathogens they can transmit most of them with implications in human and animal health Ticks are arachnids meaning that they do not share the biological and ecological features of the mosquitoes and other parasitic Diptera The natural foci of tick borne pathogens may be as large as a continent or be restricted to small portions of a country without apparently too many similar features The life cycle of the ticks involved three developing instars The precise relationships of ticks and their hosts the specific seasonal pattern of activity of ticks and the still poorly known molecular relationships between ticks and the pathogens they can transmit make these vectors a specially fecund field of research Importantly extensive studies on the biological and ecological relationships of ticks and abiotic climate and vegetation conditions have revealed the fine tuning of the ticks and the pathogens they transmit together with the biological effects of host and the

driving features by the climate The studies on tick transmitted pathogens have been on the rise in the last years There is a growing interest in understand the somewhat complex relationships between the landscape the climate the vectors and the pathogens because the concerns of spread probably driven by subtle changes in climate and man made alterations of the landscape Studies on Lyme borreliosis are addressing the interesting issue of the relationships between the climate the tick activity patterns and the selection of strains according to the reservoir availability Furthermore the expanding field of habitat suitability modeling has been applied with different degrees of success to evaluate and quantify the risk of disease transmission In such exponentially growing field revisionary books are clearly welcome additions to the bibliographical tools of researchers It is however necessary the compilation of works devoted to explore the tip of the iceberg in the field of research In this Research Topic we wish to summarize and review the studies on ecology molecular biology and tick host pathogens interactions provided to resolve the important issues of ticks and pathogens We want not only the results obtained by newly developed molecular tools but rigorous reviews of the most recent advances in these issues This Topic will cover aspects of both human and animal health with special interest on zoonoses Aspects of the biology of the ticks as affecting the transmission of pathogens are of special interest in this Topic Studies on ticks of the poorly known family Argasidae as related to their involvement on pathogen transmission are especially welcome We also wish to describe the perspective of the field in the future Finally the presentation of ongoing original works is greatly encouraged
