

Climate Change 101: climate science basics

FAST FACT:

Carbon dioxide (CO₂) is the greenhouse gas responsible for greatest amount of warming to date.

Physicians may be hesitant to talk about climate change because they aren't experts in climate science. In this section, you will find basic information about climate change — what it is, what causes it, and what we can do about it.

But you don't need to be a climate scientist to talk about the risks climate change poses to human health, or the health benefits of taking action on climate change. When physicians have a patient with a complex or rare illness, they often seek guidance from a sub-specialist with extensive training and education on that illness. Climate scientists are like sub-specialists — they are trained to understand climate patterns, and the sophisticated models that forecast those patterns in the future. If you were to consult with 100 climate scientists, you would find that:

97% of climate scientists agree:

- Climate change is happening now.
- It is being driven primarily by human activity.
- We can do something to reduce its impacts and progression.

What's the difference between weather, climate, climate variability and climate change?

- **Weather** is the temperature, humidity, precipitation, cloudiness and wind that we experience in the atmosphere at a given time in a specific location.
- **Climate** is the average weather over a long time period (30 – 50 years) in a region.
- **Climate variability** refers to natural variation in climate that occurs over months to decades. El Niño, which changes temperature, rain and wind patterns in many regions over about 2 – 7 years, is a good example of natural climate variability, also called natural variability.
- **Climate change** is "a systematic change in the long-term state of the atmosphere over multiple decades or longer."¹
 - Scientists use statistical tests to determine the probability that changes in the climate are within the range of natural variability — similar to the statistical tests used in clinical trials to determine whether a positive response to treatment is likely to have occurred by chance. For example, there is a less than 1% chance that the warming of the atmosphere since 1950 could be the result of natural climate variability.
