

Introduction

An Introduction to Energy Sources

Energy is the primary and most universal measure of all kinds of work by human beings and nature. Every thing what happens in the world is the expression of flow of energy in one of its forms. Most people use the word energy for input to their bodies or to the machines and thus think about crude fuels and electric power.

The energy sources available can be divided into three types:

1. **Primary Energy Sources** Primary energy sources can be defined as sources which provide a net supply of energy. Coal, oil, uranium etc. are examples of this type. The energy required to obtain these fuels is much less than what they can produce by combustion or nuclear reaction. Their energy yield ratio is very high. The yield ratio is defined as the energy fed back by the material to the energy received from the environment. The primary fuels only can accelerate growth but their supply is limited. It becomes very essential to use these fuels sparingly. Primary fuels contributes considerably to the energy supply.

2. **Secondary fuels** produce no net energy. Though it may be necessary for the economy, these may not yield net energy. Intensive agricultural is an example wherein terms of energy the yield is less than the input.

3. **Supplementary sources** are defined as those whose net energy yield is zero and those requiring highest investment in terms of energy. Insolation (thermal) is an example for this source. Coal, natural gas, oil and nuclear energy using breeder reactor are net energy yielders and are *primary sources of energy*. *Secondary sources* are like solar energy, wind energy, water energy etc. Solar energy can be used through plants, solar cells and solar heaters. Solar tower is another emerging technology. Solar drying and solar heating are economical applications when passive methods are used. Because of the dilute nature of solar energy it is difficult to classify the source as a primary one. Better sources are wind, tide, wave and hydroelectric applications. Geothermal and ocean thermal are the other sources which may well prove worthwhile. It may be necessary in future to develop the secondary sources like solar, wind etc.

1.Solar Energy:

The applications of solar energy which are enjoying most success to-day are :

- (1) Heating and cooling of residential building.
- (2) Solar water heating.
- (3) Solar drying of agricultural and animal products.
- (4) Solar distillation on a small community scale.
- (5) Salt production by evaporation of seawater or inland brines.
- (6) Solar cookers.
- (7) Solar engines for water pumping.
- (8) Food refrigeration.
- (9) Bio conversion and wind energy, which are indirect source of solar energy.
- (10) Solar furnaces.
- (11) Solar electric power generation by

(i) Solar ponds.

(ii) Steam generators heated by rotating reflectors (heliostat mirrors), or by tower concept.
