

DNA Structure and Replication

How is genetic information stored and copied?

Why?

Deoxyribonucleic acid or **DNA** is the molecule of heredity. It contains the genetic blueprint for life. For organisms to grow and repair damaged cells, each cell must be capable of accurately copying itself. So how does the structure of DNA allow it to copy itself so accurately?

Model 1 – The Structure of DNA

1. Refer to the diagram in Model 1.

- a. What are the three parts of a nucleotide?

Deoxyribose sugar, Phosphate, Nitrogen-containing base.

- a. What kind of sugar is found in a nucleotide?

Deoxyribose

- a. Which nucleotide component contains nitrogen?

bases (A,T,G,C)

- a. Name the four nitrogen bases shown in Model 1.

Adenine, Thymine, Guanine, Cytosine

2. DNA is often drawn in a "ladder model." Locate this drawing in Model 1.

- a. Circle a single nucleotide on each side of the ladder model of DNA.

The papers explore the initiation of DNA replication and address relevant topics such as whether there are specific protein recognition sites within an origin how many proteins interact at an origin and whether they interact in a specific temporal sequence or whether origins can be subdivided into distinct functional domains The specific biochemical steps in DNA chain initiation and how they are catalyzed are also discussed This book is organized into six sections and comprised of 41 chapters The discussion begins by analyzing the replication origin region of the Escherichia coli chromosome and the precise location of the region carrying autonomous replicating function A genetic map of the replication and incompatibility regions of the resistance plasmids R100 and R1 is described and several gene products produced in vivo or in vitro from the replication region are considered The sections that follow focus on the DNA initiation determinants of bacteriophage M13 and of chimeric derivatives carrying foreign replication determinants suppressor loci in E coli and enzymes and proteins involved in initiation of phage and bacterial chromosomes The final chapters examine the origins of eukaryotic replication This book will be of interest to scientists students and researchers in fields ranging from microbiology and molecular biology to biochemistry molecular genetics and physiology

A Dynamic Model of DNA Structure and Function Cheryl Lynn Sershen,2009 Many existing models of the DNA molecule predict equilibrium properties of its molecular structure But the biological environment within a cell is in dynamic flux The DNA molecule is constantly disrupted through biological events such as protein binding transcription replication recombination and repair Equilibrium based models portray molecular properties in the thermodynamic limit and do not reflect the near term dynamic effects of such events Developing accurate non equilibrium dynamic models is essential to understand these processes and to predict the length of time it will take the DNA molecule to relax to its equilibrium state Our research has focused on developing a dynamic statistical mechanical model for predicting the mechanical behavior of DNA in a dynamic biological environment We extend to a non equilibrium context the approach taken by Fye and Benham in their development of the equilibrium stress induced duplex destabilization SIDD model This incorporates an Ising like

framework to model the DNA molecule and predicts the equilibrium destabilization free energy and probability of denaturation for each base pair in the molecule. The non equilibrium properties of the traditional one dimensional kinetic Ising model have been thoroughly studied and we have leveraged these results in developing our approach. Our model is implemented as a time dependent simulation using Glauber dynamics. The master equation developed here allows us to introduce complexities not seen in previous non equilibrium statistical mechanical studies of the DNA molecule. The global coupling of the base pairing in the model induces physics that have not heretofore been employed in studying dynamic models of DNA. Among the measures calculated are the time series probability distributions, time dependent energies of opening and probabilities of opening for each base pair of the DNA molecule. Scenarios of transcription and protein binding are simulated using the model as a dynamic bioinformatics tool. An example of how to use the information in the superhelical stress profiles to identify features of the DNA molecule is presented. Our dynamic approach thus enables a more accurate modeling of DNA regulatory mechanisms in the cell and of the various functions of DNA in vivo.
