

DIFFUSION READING WORKSHEET

Diffusion Through Cell Boundaries

In a solution, particles move randomly. They collide with one another and tend to spread out randomly. Diffusion is the process by which molecules of a substance move from areas of higher concentration to areas of lower concentration. Because diffusion depends upon random particle movements, substances diffuse across membranes without requiring the expenditure of energy. From when equilibrium is reached, particles of a solution will continue to move across the membrane in both directions.

Explain the process of diffusion using diagrams A & B:

Explain the process of diffusion using diagrams C. Include how it "equilibrium" in your explanation.

Is energy used or not used in diffusion?

Think: How does a container with a semi-permeable membrane in the middle work? (Is the left side of the container at a high or low concentration? What will happen to the solute in the container?)

Contains reading comprehension and "think" critical thinking questions!
