

PROPERTIES OF WATER

Properties of Water

Water is a very special liquid! It is something that we use every day and it is all around us. Did you know that water has some special properties that make it different from other liquids?

One of the most important properties of water is that it is a liquid at room temperature. This means that it is not a solid like ice or a gas like steam. This makes it very easy for us to use because we can pour it and it will take the shape of its container.

Another important property of water is that it is a good solvent. This means that it can dissolve many different types of substances. For example, sugar dissolves easily in water and salt can also be dissolved in water. This is why we use water to make things like lemonade or soup.

Water is also a good conductor of heat. This means that it can absorb heat quickly and transfer it to other things. This is why we use water to cool things down, like our bodies when we take a bath or swim in a pool. It also why we use water to heat things up, like when we boil water for tea or coffee.

Water also has a property called "surface tension". This means that the surface of the water is like a skin that holds the water together. This is why you can make a paper boat float on a puddle of water and why insects can walk on water.

Water also has a property called "cohesion." Cohesion means that water molecules stick to each other. This is why water droplets form when you take a shower and why water stays in a glass when you pour it.

Finally, Water has a property called "Adhesion" means water molecules stick to other surfaces, like the sides of a glass or the roots of a plant. This is why water can travel up a plant stem and why it can stick to a window on a rainy day.

In conclusion, water has many special properties that make it
