Goal-directed fluid therapy during major abdominal surgery Hans Bahlmann, 2019-04-10 Background Both hypo and hypervolemia increase the risk for postoperative complications after major abdominal surgery Fluid needs vary amongst patients depending on differences in preoperative dehydration intraoperative physiology and surgical characteristics Goal directed fluid therapy GDFT aims to target the right amount of fluid administration in each patient by evaluating the effect of fluid boluses on haemodynamic parameters such as stroke volume It has been shown to reduce postoperative morbidity and is generally recommended for high risk surgery The overall aim of this thesis was to evaluate whether more simple devices for GDFT result in clinical benefit thus facilitating the application of GDFT in more patients Aim To compare performance and clinical benefit of pleth variability index PVI a noninvasive easy to use device for GDFT with the reference method of oesophageal Doppler to evaluate methods for measuring preoperative dehydration and its effect on fluid handling by the body and to confirm the expected clinical benefits of GDFT in patients undergoing oesophageal resection a high risk procedure Methods In Studies I III 150 patients scheduled for open abdominal surgery of at least 2 hrs were randomised to GDFT with either PVI or oesophageal Doppler In the first half of the cohort both monitors were connected to compare intraoperative performance In 30 patients preoperative dehydration was analysed In study IV 64 patients undergoing oesophageal resection were randomised to GDFT using pulse contour analysis or standard treatment Results The concordance between PVI and oesophageal Doppler for indicating the need for and effect of a fluid bolus was low and both had only limited capacity to predict the effect of a fluid bolus Both methods resulted in comparable amounts of fluid being administered and similar clinical outcome Preoperative dehydration was limited but did impact on fluid handling Patients receiving GDFT during oesophageal resection received more fluid and more dobutamine compared to controls but this did not result in any clinical benefit Conclusions There are methodological issues as well as uncertainties about the clinical benefit of GDFT We cannot recommend a strict application of any GDFT strategy but suggest that its components should be incorporated in a more
