RNA

1

(1) What information level is a unit of nucleic acid that stores a sequence code for protein synthesis. The principle of "mating partners." The genetic information in DNA is transcribed into RNA, which is then translated into proteins in a process called the Central Dogma of Biology. Proteins are the building blocks of the cell and carry out a variety of important functions in the human body.

(2) What DNA, RNA is composed of a long chain of nucleotides. Nucleotides consist of a phosphate group, a sugar, and a nitrogenous base. The sugar-phosphate backbone of nucleic acids consists of alternating phosphate groups and deoxyribose. Nitrogenous bases are the building blocks of the genetic code. They are the building blocks of the genetic code. They are the building blocks of the genetic code.

(3) There are three main types of RNA, each with its own unique function.

1. Messenger RNA (mRNA) carries the genetic information from DNA in the nucleus for creating a complementary strand of protein from the code on the DNA strand. Once this strand is created, a genetic information, it carries the message and carries the instructions for the proteins in the cytoplasm. It is the building blocks of the genetic code.

2. Transfer RNA (tRNA) carries the genetic information from mRNA into a specific sequence of amino acids, which are the building blocks of proteins. tRNA carries the genetic code and is the building blocks of the genetic code. It is the building blocks of the genetic code.

3. Ribosomal RNA (rRNA) is the site of protein synthesis and is a major component of ribosomes. Ribosomes are protein and RNA structures that are found in the cytoplasm of a cell. Proteins are synthesized by the ribosomes. The ribosomes are the site of protein synthesis.
