

A nutritional example: the lactase gene

Many adult humans cannot metabolise lactose (milk sugar). A single nucleotide polymorphism (SNP), i.e., a one basepair difference in DNA sequence, correlates with activation of the lactase promoter and with lactose tolerance/intolerance.

Moreover, this simple change can be seen to affect the binding activity of a transcription factor, Oct-1, to the relevant CRM.

There are likely to be many such instances of how changes in gene regulation affect nutrition, health, and disease, although most remain to be discovered.
