Organophosphorus Chemistry D W Hutchinson, J A Miller, 2007-10-31. Organophosphorus Chemistry provides a comprehensive annual review of the literature. Coverage includes phosphines and their chalcogenides, phosphonium salts, low coordination number phosphorus compounds, penta and hexa coordinated compounds, trivalent phosphorus acids, nucleotides and nucleic acids, ylides and related compounds, and phosphazenes. The series will be of value to research workers in universities, government, and industrial research organizations whose work involves the use of organophosphorus compounds. It provides a concise but comprehensive survey of a vast field of study with a wide variety of applications, enabling the reader to rapidly keep abreast of the latest developments in their specialist areas. Specialist Periodical Reports provide systematic and detailed review coverage of progress in the major areas of chemical research. Written by experts in their specialist fields, the series creates a unique service for the active research chemist, supplying regular critical in depth accounts of progress in particular areas of chemistry. For over 80 years, the Royal Society of Chemistry and its predecessor, the Chemical Society, have been publishing reports charting developments in chemistry, which originally took the form of Annual Reports. However, by 1967, the whole spectrum of chemistry could no longer be contained within one volume, and the series Specialist Periodical Reports was born. The Annual Reports themselves still existed but were divided into two and subsequently three volumes covering Inorganic, Organic, and Physical Chemistry. For more general coverage of the highlights in chemistry, they remain a must. Since that time, the SPR series has altered according to the fluctuating degree of activity in various fields of chemistry. Some titles have remained unchanged, while others have altered their emphasis along with their titles; some have been combined under a new name, whereas others have had to be discontinued. The current list of Specialist Periodical Reports can be seen on the inside flap of this volume.

HIV on Dendritic Cells Rada Ellegård,2018-09-28 Dendritic cells are key players during HIV pathogenesis and shape both the immediate immune response at the site of infection as well as directing the adaptive immune response against the virus HIV has developed a plethora of immune evasion mechanisms that hijack dendritic cell functions suppressing their ability to mount an accurate immune response and exploiting them for efficient viral transfer to target T cells To achieve successful replication within dendritic cells without triggering danger signaling HIV accomplishes a delicate balance where only a low level of transcription can be sustained without triggering antiviral responses that would harm the virus Here we describe how the presence of HSV2 coinfection which is very common in geographic areas with a high HIV prevalence and almost triples the risk of HIV acquisition alters dendritic cell state to support much higher levels of HIV infection We found this effect to be mediated by the STING pathway which is involved in the sensing of DNA in the cell cytosol STING activation led to an upregulation of factors such as IRF3 and NFκB that can be used for HIV transcription and a degradation of factors that restrict HIV replication In addition we describe how HIV exploits the human complement system a group of proteins that

usually help the human body to identify dangerous pathogens while avoiding reaction towards self HIV can coat itself i.e. become opsonized in complement fragments that are typically only present on the body's own cells allowing it to activate signaling pathways that are associated with tolerance Dendritic cells that come into contact with complement opsonized HIV do not mount danger responses despite the fact that HIV derived single stranded RNA triggers the pathogen recognition receptor TLR8 The suppression of danger responses is mediated by activation of complement receptor 3 and leads to an increased infection of the dendritic cell and affects its interactions with other immune cells There is a lack of recruitment of NK cells to the site of infection and an inhibition of NK cell killing which plays an important role in the destruction of HIV infected cells in vivo T cells primed by dendritic cells exposed to complement opsonized HIV have a lower ability to develop towards effector phenotype and have an increased expression of the markers PD1 TIM3 and LAG3 which are associated with T cell dysfunction and exhaustion In addition T cells primed by these dendritic cells in the presence of NK cells upregulate markers CD38 CXCR3 and CCR4 which have been linked to an increased susceptibility to HIV infection In summary we add to the current knowledge on HIV immune evasion mechanisms that allow the virus to establish infection as well as describing mechanisms that govern whether dendritic cells mount danger signaling and an immune response or not The Practice of Navigation and Nautical Astronomy ... Although there are thousands of research papers on crustal permeability this is the first book length treatment This book bridges the historical dichotomy between the hydrogeologic perspective of permeability as a static material property and the perspective of other Earth scientists who have long recognized permeability as a dynamic parameter that changes in response to tectonism fluid production and geochemical reactions *Advances in Botanical Research* ,1996-02-26
