Vazquez-Yanes, 2012-12-06 This book contains the results of a Symposium on the physiological ecology of plants of the lowland wet tropics held in Mexico in June 1983 organized by the Instituto de Biología of the National University of Mexico U N A M and sponsored by UNAM CONACYT NSF and UNESCO CIET A workshop portion of the Symposium was held at the tropical research station at Los Tuxtlas Veracruz This Symposium originated in response to the increasing interest in the physiological ecology of tropical plants because of the potential of this field to provide a basic understanding of functioning of tropical plant communities The study of physiological ecology of tropical plants has been delayed in some cases by the lack of conceptual framework but also by the absence of appropriate instrumentation and techniques with which to conduct precise measurements under high temperature high humidity field conditions Hypotheses and concepts of the physiological ecology of tropical plants have been based mainly on observational data and the analysis of growth forms and leaf anatomy The early work of A F W Schimper and O Stocker in Asia and the extensive surveys made by H Walter on the osmotic potentials of plants in the tropics and subtropics constituted until relatively recently the only available information on the water and carbon relations of tropical plants **Official Journal of the European Communities** , 1988

Neuroimmunology is a rapidly growing emerging field at which two old sciences have converged to integrate two different types of responses into a single coherent response involving the coordinated action of both systems neural and immune During long time it was thought that both systems worked separately and in divergent pathways The brain was considered an immunoprivileged site and the immune organs were deemed as independent of any neural influence and also of nervous innervation Time has gone and has proven that the borders between both systems were merely artificial Since the beginning of Neuroimmunology in the 1980s much work has been done to elucidate the gates and fences in neuro immune interactions Brain was shown to be under the continuous surveillance of the immune system even under basal physiological conditions in the absence of any pathology Likely it was found a profuse nervous innervation of lymphoid organs and even of single immune cells Gates for direct neural immune communication were found both centrally and peripherally Centrally the gates but also the fences were situated at the brain barriers the blood brain barrier and the blood cerebrospinal fluid barrier and at the circumventricular organs Peripherally the fences constituted the apparent diverse nature of molecules involved in neural and immune signaling however time proved that both system were capable of producing the same signaling molecules and also systematically responded to the molecules released by the other system Therefore the gates were open for direct neural immune communication at the peripheral level This Research Topic aimed to include original reports reviews and technical reports regarding the description of the gates and fences in neural immune interactions We intended to provide an extensive view of the mechanisms governing central and peripheral neural immune interactions and the role of the borders the blood neural barriers in the regulation of the neural immune communication **Handbook on the Toxicology of Metals** Gunnar F.
