regenerative medicine applications which has in turn spurred growing numbers of translational and clinical studies. However, more work is needed if the potential is to be realized for improvement of the lives and well-being of patients with numerous diseases and conditions. This book series, *Cell Biology and Translational Medicine (CBTMED)*, as part of Springer Nature's longstanding and very successful *Advances in Experimental Medicine and Biology* book series, has the goal to accelerate advances by timely information exchange. Emerging areas of regenerative medicine and translational aspects of stem cells are covered in each volume. Outstanding researchers are recruited to highlight developments and remaining challenges in both the basic research and clinical arenas. This current book is the 15th volume of a continuing series. *Biochemistry and Cell Biology of Ageing: Part I Biomedical Science*. J. Robin Harris, Viktor I. Korolchuk, 2019-02-18. This new volume in the Subcellular Biochemistry series will focus on the biochemistry and cellular biology of aging processes in human cells. The chapters will be written by experts in their respective fields and will focus on a number of the current key areas of research in subcellular aging research. Main topics for discussion are mitochondrial aging, protein homeostasis and aging, and the genetic processes that are involved in aging. There will also be chapters that are dedicated to the study of the roles of a variety of vitamins and minerals on aging and a number of other external factors: microbiological, ROS, inflammation, nutrition. This book will provide the reader with a state-of-the-art overview of the subcellular aging field. This book will be published in cooperation with a second volume that will discuss the translation of the cell biology of aging to a more clinical setting, and it is hoped that the combination of these two volumes will bring a deeper understanding of the links between the cell and the body during aging. *Cell Biology and Translational Medicine, Volume 25*. Kursad Turksen, 2025-08-03. This next volume in the *Cell Biology and Translational Medicine* series continues to explore the promising applications of stem cells in regenerative medicine. The topics presented in this volume address aspects of stem cell regeneration both in health and disease. The volume looks at the roles of the interactome, secretome, genome stabilizers, epigenetic regulation, organoids, and bioprinting in stem cell biology and regeneration. Additionally, it highlights recent advancements in therapies for eye diseases. A goal of the series continues to be to highlight timely, often emerging topics and novel approaches that can accelerate the utility of stem cells in regenerative medicine.

Systems Biology and the Challenge of Deciphering the Metabolic Mechanisms Underlying Cancer. Osbaldo Resendis-Antonio, Christian Diener, 2017-11-23. Since the discovery of the Warburg effect in the 1920s, cancer has been tightly associated with the genetic and metabolic state of the cell. One of the hallmarks of cancer is the alteration of the cellular metabolism in order to promote proliferation and undermine cellular defense mechanisms such as apoptosis or detection by the immune system. However, the strategies by which this is achieved in different cancers and sometimes even in different patients of the same cancer is very heterogeneous, which hinders the design of general treatment options. Recently, there has been an ongoing effort to study this phenomenon on a genomic scale in order to understand the causality underlying the disease. Hence, current omics technologies have contributed to identify

and monitor different biological pieces at different biological levels such as genes proteins or metabolites These technological capacities have provided us with vast amounts of clinical data where a single patient may often give rise to various tissue samples each of them being characterized in detail by genomescale data on the sequence expression proteome and metabolome level Data with such detail poses the imminent problem of extracting meaningful interpretations and translating them into specific treatment options To this purpose Systems Biology provides a set of promising computational tools in order to decipher the mechanisms driving a healthy cell s metabolism into a cancerous one However this enterprise requires bridging the gap between large data resources mathematical analysis and modeling specifically designed to work with the available data This is by no means trivial and requires high levels of communication and adaptation between the experimental and theoretical side of research

Biochemistry and Cell Biology of Ageing: Part II Clinical Science J. Robin Harris,Viktor I. Korolchuk,2019-03-19 This volume of the subcellular Biochemistry series will attempt to bridge the gap between the subcellular events that are related to aging as they were described in the first volume of this set of two books and the reality of aging as this is seen in clinical practice All chapters will start from the biochemistry or cell biology where the data is available and work up towards the understanding that we have of aging in the various areas that are related to the subject Key focus points for this volume are nutrition external factors and genetics on aging There will also be chapters that will focus on various organs or tissues in which aging has been well studied like the eyes the muscles the immune system and the bones The aim of the book project and the book project that is published in concert with this volume is to bring the subcellular and clinical areas into closer contact

Mitogen Activated Protein Kinases Ana Cuenda,José M. Lizcano,José Lozano,2017-11-29 Mitogen activated protein kinase MAPK pathways are evolutionarily conserved in all eukaryotes and allow cells to respond to changes in the physical and chemical properties of the environment and to produce an appropriate response by altering many cellular functions MAPKs are among the most intensively studied signal transduction systems MAPK research is a very dynamic field in which

new perspectives are continuously opening to the scientific community. Importantly, many MAPK inhibitors have been developed during the last years and are currently being tested in preclinical and clinical assays for inflammatory diseases and cancer treatment. In this research topic, we have gathered 14 papers covering recent advances in different aspects of the MAPK research area that have provided valuable insight into the spatiotemporal dynamics, the regulation and functions of MAPK pathways as well as their therapeutic potential. We hope that this Research Topic helps readers to have a better understanding of the progresses that have been made recently in the field of MAPK signalling. A deeper understanding of these pathways will facilitate the development of innovative therapeutic approaches.
