techniques and enables a physically accurate auralization of sound propagation in complex environments including important wave effects such as sound scattering airborne sound insulation between rooms and sound diffraction Despite this realistic sound field rendering not only spatially distributed and freely movable sound sources and receivers are supported at runtime but also modifications and manipulations of the environment itself All major features are evaluated by investigating both the overall accuracy of the room acoustics simulation and the performance of implemented algorithms and possibilities for further simulation optimizations are identified by assessing empirical studies of subjects operating in immersive environments
