Proceedings of 17th Symposium on Earthquake Engineering (Vol. 3) Manish Shrikhande, Pankaj Agarwal, P. C. Ashwin Kumar, 2023-07-03 This book presents select proceedings of the 17th Symposium on Earthquake Engineering organized by the Department of Earthquake Engineering Indian Institute of Technology Roorkee The topics covered in the proceedings include engineering seismology and seismotectonics earthquake hazard assessment seismic microzonation and urban planning dynamic properties of soils and ground response ground improvement techniques for seismic hazards computational soil dynamics dynamic soil structure interaction codal provisions on earthquake resistant design seismic evaluation and retrofitting of structures earthquake disaster mitigation and management and many more This book also discusses relevant issues related to earthquakes such as human response and socioeconomic matters post earthquake rehabilitation earthquake engineering education public awareness participation and enforcement of building safety laws and earthquake prediction and early warning system This book is a valuable reference for researchers and professionals working in the area of earthquake engineering *STESSA 2000: Behaviour of Steel Structures in Seismic Areas* Federico Mazzolani, Robert Tremblay, 2021-07-28 This is a review of developments in the behaviour and design of steel structures in seismic areas The proceedings look at the analytical and experimental research on the seismic response of steel structures and cover topics such as global behaviour and codification design and application **Measuring, Modeling and Predicting the Seismic Site Effect** Yefei Ren, Giovanni Lanzano, Yadab P. Dhakal, Behzad Hassani, Kun Ji, 2024-01-25 As recognized universally by both seismology and earthquake engineering communities the amplitude and frequency content of ground motions are influenced by local site effects including the effects of near surface geologic materials surface topographic and basin effects and so on Strong linkage between seismic site effect and earthquake damage has been commonly demonstrated from many past earthquakes Therefore quantitative and reliable evaluation of the seismic site effect is one of the crucial aspects in seismic hazard assessment and risk mitigation With the significant advancement of modern seismic monitoring networks and arrays huge amounts of high quality seismic records are now being accumulated This encourages us to measure the site responses and its associated uncertainty for selected seismic stations by some record dependent approaches such as horizontal to vertical spectral ratio HVSr measurements generalized spectral inversion GIT methods etc Machine learning techniques also show significant promise in characterization of the near surface geologic properties and prediction of site response These data driven approaches help us to better understand the physics of spatial and temporal variabilities of ground motions Due to more and more site specific data being captured invoking non ergodic assumptions in seismic response analysis has recently been a topic of great interest in the community For specific site response analysis numerical simulations are carried out to model the dynamic process of seismic waves propagating and scattering in the subsurface strata With development of modeling capacity great efforts have been taken to evaluate

quantitatively the complex 2D and 3D effects on seismic site response

Soil-structure interaction in seismic analysis Alexander Tyapin, 2019-06-11 Soil structure interaction SSI is an important phenomenon in the seismic response analysis As seismologists describe seismic excitation in terms of the seismic motion of certain control point at the free surface of the initial site the question is whether the same point of the structure after structure appears will have the same seismic response motion in case of the same seismic event If yes then seismic motion from seismologists is directly applied to the base of the structure it is called fixed base analysis and they say that no SSI occurs though literally speaking soil is forcing structure to move so interaction is always present This is a conventional approach in the field of civil engineering However if heavy and rigid structure sometimes embedded is erected on medium or soft soil site this structure changes the seismic response motion of the soil as compared to the initial free field picture Such a situation is typical for Nuclear Power Plants NPPs deeply embedded structures etc The book describes different approaches to SSI analysis and different SSI effects Special attention is paid to the Combined Asymptotic Method CAM developed by the author and used for the design of NPPs in seismic regions Nowadays some civil structures have parameters comparable to those of NPPs e g masses and embedment so these approaches become useful for the civil structural engineers as well Paperback <https://amzn.to/38B4zsE>
