Teaching School Mathematics: Pre-Algebra Hung-Hsi Wu:, 2016-06-29 This is a systematic exposition of a major part of the mathematics of grades 5 to 8 excluding statistics written specifically for Common Core era teachers It differs from other books for teachers in that the mathematics is correct in the sense that all the concepts are clearly and correctly defined and a grade appropriate explanation that is proof is given for every assertion For example it gives a precise definition of percent and explains how to use the definition to do all the standard problems about percent in an entirely routine manner It also gives a leisurely explanation for negative times negative is positive Another key feature is an intuitive introduction to plane geometry via rotations translations reflections and dilations that instead of treating these transformations as merely fun

activities shows how they make sense of the usual geometric topics in middle school including congruence similarity length area and volume In short the readers will find in this volume a clear explanation of whatever was once puzzling to them in the mathematics of grades 5 to 8 **Mathematics Curriculum in School Education** Yeping Li,Glenda Lappan,2013-11-19 Mathematics curriculum which is often a focus in education reforms has not received extensive research attention until recently Ongoing mathematics curriculum changes in many education systems call for further research and sharing of effective curriculum policies and practices that can help lead to the improvement of school education This book provides a unique international perspective on diverse curriculum issues and practices in different education systems offering a comprehensive picture of various stages along curriculum transformation from the intended to the achieved and showing how curriculum changes in various stages contribute to mathematics teaching and learning in different educational systems and cultural contexts The book is organized to help readers learn not only from reading individual chapters but also from reading across chapters and sections to explore broader themes including Identifying what is important in mathematics for teaching and learning in different education systems Understanding mathematics curriculum and its changes that are valued over time in different education systems Identifying and analyzing effective curriculum practices Probing effective infrastructure for curriculum development and implementation Mathematics Curriculum in School Education brings new insights into curriculum policies and practices to the international community of mathematics education with 29 chapters and four section prefaces contributed by 56 scholars from 14 different education systems This rich collection is indispensable reading for mathematics educators researchers curriculum developers and graduate students interested in learning about recent curriculum development research and practices in different education systems It will help readers to reflect on curriculum policies and practices in their own education systems and also inspire them to identify and further explore new areas of curriculum research for improving mathematics teaching and learning And the Rest is Just Algebra Sepideh Stewart,2016-10-20 This book addresses college students weak foundation in algebra its causes and potential solutions to improve their long term success and understanding in mathematics as a whole The authors who are experts in a wide variety of fields emphasize that these difficulties are more complex than just forgotten rules and offer strategic approaches from a number of angles that will increase the chances of student understanding Instructors who are frustrated with their students lack of skills and knowledge at college level will find this volume helpful as the authors confront the deeper reasons why students have difficulties with Algebra and reveal how to remedy the issue Teaching and Learning Algebraic Thinking with 5- to 12-Year-Olds Carolyn Kieran,2017-12-04 This book highlights new developments in the teaching and learning of algebraic thinking with 5 to 12 year olds Based on empirical findings gathered in several countries on five continents it provides a wealth of best practices for teaching early algebra Building on the work of the ICME 13 International Congress on Mathematical Education Topic Study Group 10 on Early Algebra well known authors such as Luis Radford John Mason Maria

Blanton Deborah Schifter and Max Stephens as well as younger scholars from Asia Europe South Africa the Americas Australia and New Zealand present novel theoretical perspectives and their latest findings The book is divided into three parts that focus on i epistemological mathematical aspects of algebraic thinking ii learning and iii teaching and teacher development Some of the main threads running through the book are the various ways in which structures can express themselves in children s developing algebraic thinking the roles of generalization and natural language and the emergence of symbolism Presenting vital new data from international contexts the book provides additional support for the position that essential ways of thinking algebraically need to be intentionally fostered in instruction from the earliest grades

together give an exposition of the mathematics of grades 9–12 that is simultaneously mathematically correct and grade level appropriate. The volumes are consistent with CCSSM Common Core State Standards for Mathematics and aim at presenting the mathematics of K–12 as a totally transparent subject. The first part of this volume is devoted to the study of standard algebra topics: quadratic functions, graphs of equations of degree 2 in two variables, polynomials, exponentials, and logarithms, complex numbers, and the fundamental theorem of algebra and the binomial theorem. Having translations and the concept of similarity at our disposal enables us to clarify the study of quadratic functions by concentrating on their graphs the same way the study of linear functions is greatly clarified by knowing that their graphs are lines. We also introduce the concept of formal algebra in the study of polynomials with complex coefficients. The last three chapters in this volume complete the systematic exposition of high school geometry that is consistent with CCSSM. These chapters treat the geometry of the triangle and the circle, ruler and compass constructions, and a general discussion of axiomatic systems including non-Euclidean geometry and the celebrated work of Hilbert on the foundations. This book should be useful for current and future teachers of K–12 mathematics as well as for some high school students and for education professionals.
