Secondary Mathematics for Mathematicians and Educators Michael Weiss,2020-10-05 In this engaging text Michael Weiss offers an advanced view of the secondary mathematics curriculum through the prism of theory analysis and history aiming to take an intellectually and mathematically mature perspective on the content normally taught in high school mathematics courses Rather than a secondary mathematics textbook Weiss presents here a textbook about the secondary mathematics curriculum written for mathematics educators and mathematicians and presenting a long overdue modern day integration of the disparate topics and methods of secondary mathematics into a coherent mathematical theory Areas covered include Polynomials and polynomial functions Geometry graphs and symmetry Abstract algebra linear algebra

and solving equations Exponential and logarithmic functions Complex numbers The historical development of the secondary mathematics curriculum Written using precise definitions and proofs throughout on a foundation of advanced content knowledge Weiss offers a compelling and timely investigation into the secondary mathematics curriculum relevant for preservice secondary teachers as well as graduate students and scholars in both mathematics and mathematics education

Certain Number-Theoretic Episodes In Algebra, Second Edition R Sivaramakrishnan, 2019-03-19 The book attempts to point out the interconnections between number theory and algebra with a view to making a student understand certain basic concepts in the two areas forming the subject matter of the book The Practice of Algebraic Curves David Eisenbud, Joe Harris, 2024-11-09 This textbook provides readers with a working knowledge of the modern theory of complex projective algebraic curves Also known as compact Riemann surfaces such curves shaped the development of algebraic geometry itself making this theory essential background for anyone working in or using this discipline Examples underpin the presentation throughout illustrating techniques that range across classical geometric theory modern commutative algebra and moduli theory The book begins with two chapters covering basic ideas including maps to projective space invertible sheaves and the Riemann Roch theorem Subsequent chapters alternate between a detailed study of curves up to genus six and more advanced topics such as Jacobians Hilbert schemes moduli spaces of curves Severi varieties dualizing sheaves and linkage of curves in 3 space Three chapters treat the refinements of the Brill Noether theorem including applications and a complete proof of the basic result Two chapters on free resolutions rational normal scrolls and canonical curves build context for Green's conjecture The book culminates in a study of Hilbert schemes of curves through examples A historical appendix by Jeremy Gray captures the early development of the theory of algebraic curves Exercises illustrations and open problems accompany the text throughout The Practice of Algebraic Curves offers a masterclass in theory that has become essential in areas ranging from algebraic geometry itself to mathematical physics and other applications Suitable for students and researchers alike the text bridges the gap from a first course in algebraic geometry to advanced literature and active research **Introduction to Complex Manifolds** John M. Lee, 2024-05-15 Complex manifolds are smooth manifolds endowed with coordinate charts that overlap holomorphically They have deep and beautiful applications in many areas of mathematics This book is an introduction to the concepts techniques and main results about complex manifolds mainly compact ones and it tells a story Starting from familiarity with smooth manifolds and Riemannian geometry it gradually explains what is different about complex manifolds and develops most of the main tools for working with them using the Kodaira embedding theorem as a motivating project throughout The approach and style will be familiar to readers of the author's previous graduate texts new concepts are introduced gently with as much intuition and motivation as possible always relating new concepts to familiar old ones with plenty of examples The main prerequisite is familiarity with the basic results on topological smooth and Riemannian manifolds The book is intended for graduate students and researchers in

differential geometry but it will also be appreciated by students of algebraic geometry who wish to understand the motivations analogies and analytic results that come from the world of differential geometry *Translation Surfaces* Jayadev S. Athreya, Howard Masur, 2024-04-17 This textbook offers an accessible introduction to translation surfaces Building on modest prerequisites the authors focus on the fundamentals behind big ideas in the field ergodic properties of translation flows counting problems for saddle connections and associated renormalization techniques Proofs that go beyond the introductory nature of the book are deftly omitted allowing readers to develop essential tools and motivation before delving into the literature Beginning with the fundamental example of the flat torus the book goes on to establish the three equivalent definitions of translation surface An introduction to the moduli space of translation surfaces follows leading into a study of the dynamics and ergodic theory associated to a translation surface Counting problems and group actions come to the fore in the latter chapters giving a broad overview of progress in the 40 years since the ergodicity of the Teichmüller geodesic flow was proven Exercises are included throughout inviting readers to actively explore and extend the theory along the way Translation Surfaces invites readers into this exciting area providing an accessible entry point from the perspectives of dynamics ergodicity and measure theory Suitable for a one or two semester graduate course it assumes a background in complex analysis measure theory and manifolds while some familiarity with Riemann surfaces and ergodic theory would be beneficial *Alexandrov Geometry* Stephanie Alexander, Vitali Kapovitch, Anton Petrunin, 2024-05-24 Alexandrov spaces are defined via axioms similar to those of the Euclid axioms but where certain equalities are replaced with inequalities Depending on the signs of the inequalities we obtain Alexandrov spaces with curvature bounded above CBA and curvature bounded below CBB Even though the definitions of the two classes of spaces are similar their properties and known applications are quite different The goal of this book is to give a comprehensive exposition of the structure theory of Alexandrov spaces with curvature bounded above and below It includes all the basic material as well as selected topics inspired by considering Alexandrov spaces with CBA and with CBB simultaneously The book also includes an extensive problem list with solutions indicated for every problem *Optimization in Function Spaces* Amol Sasane, 2016-03-15 Classroom tested at the London School of Economics this original highly readable text offers numerous examples and exercises as well as detailed solutions Prerequisites are multivariable calculus and basic linear algebra 2015 edition

Fields Medallists' Lectures, 2nd Edition Michael Atiyah, Daniel Iagolnitzer, 2003-11-03 Although the Fields Medal does not have the same public recognition as the Nobel Prizes they share a similar intellectual standing It is restricted to one field that of mathematics and an age limit of 40 has become an accepted tradition Mathematics has in the main been interpreted as pure mathematics and this is not so unreasonable since major contributions in some applied areas can be and have been recognized with Nobel Prizes A list of Fields Medallists and their contributions provides a bird's eye view of mathematics over the past 60 years It highlights the areas in which at various times greatest progress has been made This volume does

not pretend to be comprehensive nor is it a historical document On the other hand it presents contributions from Fields Medallists and so provides a highly interesting and varied picture The second edition of Fields Medallists Lectures features additional contributions from the following Medallists Kunihiro Kodaira 1954 Richard E Borcherds 1998 William T Gowers 1998 Maxim Kontsevich 1998 Curtis T McMullen 1998 and Vladimir Voevodsky 2002 **Linear Algebra in Action** Harry Dym, 2023-07-18 This book is based largely on courses that the author taught at the Feinberg Graduate School of the Weizmann Institute It conveys in a user friendly way the basic and advanced techniques of linear algebra from the point of view of a working analyst The techniques are illustrated by a wide sample of applications and examples that are chosen to highlight the tools of the trade In short this is material that the author has found to be useful in his own research and wishes that he had been exposed to as a graduate student Roughly the first quarter of the book reviews the contents of a basic course in linear algebra plus a little The remaining chapters treat singular value decompositions convexity special classes of matrices projections assorted algorithms and a number of applications The applications are drawn from vector calculus numerical analysis control theory complex analysis convex optimization and functional analysis In particular fixed point theorems extremal problems best approximations matrix equations zero location and eigenvalue location problems matrices with nonnegative entries and reproducing kernels are discussed This new edition differs significantly from the second edition in both content and style It includes a number of topics that did not appear in the earlier edition and excludes some that did Moreover most of the material that has been adapted from the earlier edition has been extensively rewritten and reorganized
