Risk, Capital Costs, and Project Financing Decisions F.G.J. Derkinderen, R.L. Crum, 2012-12-06 The ending of the decade of the seventies and the dawning of the eighties can be characterized as a period of great uncertainty with prospects for economic political instability High inflation and fluctuating exchange rates in the developed Western world have served to strengthen the forces of disequilibrium in the financial markets leading to an investment situation with several unusual but significant factors Capital spending by business leading to the creation of new jobs has not been reduced substantially during this period of uncertainty as happened in similar periods in the past This is shown in part by the continuing low unemployment rates in evidence during the period which are in contradiction to the trend exhibited in similar past periods The expanding financing requirements resulting from high price inflation have led to an increase in the capital intensity of firms and thus to enhanced sensitivity of their income streams to economic fluctuations At the same time the record high interest rates that companies have had to pay to acquire this inflated amount of capital have caused a deterioration in the safety or quality indicators by which the creditworthiness of the firms is judged These developments tend to increase

Computational Algebraic Number Theory Henri Cohen,2013-04-17 With the advent of powerful computing tools and numerous advances in mathematics computer science and cryptography algorithmic number theory has become an important subject in its own right Both external and internal pressures gave a powerful impetus to the development of more powerful algorithms These in turn led to a large number of spectacular breakthroughs To mention but a few the LLL algorithm which has a wide range of applications including real world applications to integer programming primality testing and factoring algorithms sub exponential class group and regulator algorithms etc Several books exist which treat parts of this subject It is essentially impossible for an author to keep up with the rapid pace of progress in all areas of this subject Each book emphasizes a different area corresponding to the author's tastes and interests The most famous but unfortunately the oldest is Knuth's Art of Computer Programming especially Chapter 4 The present book has two goals First to give a reasonably comprehensive introductory course in computational number theory In particular although we study some subjects in great detail others are only mentioned but with suitable pointers to the literature Hence we hope that this book can serve as a first course on the subject A natural sequel would be to study more specialized subjects in the existing literature **The Mathematics Education for the Future Project - Proceedings of the 14th International**
