Atmosphere, Ocean and Climate Dynamics John Marshall, R. Alan Plumb, 2007-12-19 For advanced undergraduate and beginning graduate students in atmospheric oceanic and climate science *Atmosphere Ocean and Climate Dynamics* is an introductory textbook on the circulations of the atmosphere and ocean and their interaction with an emphasis on global scales It will give students a good grasp of what the atmosphere and oceans look like on the large scale and why they look that way The role of the oceans in climate and paleoclimate is also discussed The combination of observations theory and accompanying illustrative laboratory experiments sets this text apart by making it accessible to students with no prior training in meteorology or oceanography Written at a mathematical level that is appealing for undergraduates and beginning graduate students Provides a useful educational tool through a combination of observations and laboratory demonstrations which can be viewed over the web Contains instructions on how to reproduce the simple but informative laboratory experiments Includes copious problems with sample answers to help students learn the material

Frontiers of Climate Modeling J. T. Kiehl, V. Ramanathan, 2011-06-30 The physics and dynamics of the atmosphere and atmosphere ocean interactions provide the foundation of modern climate models upon which our understanding of the chemistry and biology of ocean and land surface processes are built Originally published in 2006 Frontiers of Climate Modeling captures developments in modeling the atmosphere and their implications for our understanding of climate change whether due to natural or anthropogenic causes Emphasis is on elucidating how greenhouse gases and aerosols are altering the radiative forcing of the climate system and the sensitivity of the system to such perturbations An expert team of authors

address key aspects of the atmospheric greenhouse effect clouds aerosols atmospheric radiative transfer deep convection dynamics large scale ocean dynamics stratosphere troposphere interactions and coupled ocean atmosphere model development The book is an important reference for researchers and advanced students interested in the forces driving the climate system and how they are modeled by climate scientists

Modelling Ocean Climate Variability Artem S.

Sarkisyan,Jürgen Sündermann,2009-05-13 In this wide ranging and comprehensive review of the historical development and current status of ocean circulation models the analysis extends from simple analytical approaches to the latest high resolution numerical models with data assimilation The authors both of whom are pioneer scientists in ocean and shelf sea modelling look back at the evolution of Western and Eastern modelling methodologies during the second half of the last century They also present the very latest information on ocean climate modelling and offer examples for a number of oceans and shelf seas The book includes a critical analysis of literature on ocean climate variability modelling as well as assessing the strengths and weaknesses of the best known modelling techniques It also anticipates future developments in the field focusing on models based on a synthesis of numerical simulation and field observation and on nonlinear thermodynamic model data synthesis

Topics in Geophysical Fluid Dynamics: Atmospheric Dynamics, Dynamo Theory, and Climate Dynamics M. Ghil,S. Childress,2012-12-06

The vigorous stirring of a cup of tea gives rise as we all know to interesting fluid dynamical phenomena some of which are very hard to explain In this book our cup of tea contains the currents of the Earth s atmosphere oceans mantle and fluid core Our goal is to under stand the basic physical processes which are most important in describing what we observe directly or indirectly in these complex systems While in many respects our understanding is measured by the ability to predict the focus here will be on relatively simple models which can aid our physical intuition by suggesting useful mathematical methods of investiga tion These elementary models can be viewed as part of a hierarchy of models of increasing complexity moving toward those which might be use fully predictive The discussion in this book will deal primarily with the Earth Interplanetary probes of Venus Mars Jupiter and Saturn have revealed many exciting phenomena which bear on geophysical fluid dynamics They have also enabled us to see the effect of changing the values of certain parameters such as gravity and rotation rate on geophysical flows On the other hand satellite observations of our own planet on a daily and hourly basis have turned it into a unique laboratory for the study of fluid motions on a scale never dreamt of before the motion of cyclones can be observed via satellite just as wing tip vortices are studied in a wind tunnel

 Varotsos, 2012-12-06 During recent decades the stirring up of the processes of globalization practically in all spheres of
 present day civilization activities has aggravated and brought forth numerous problems resulting from the nature society N S
 interaction It has become apparent that to solve these problems it is necessary to develop new concepts and approaches to
 the interpretation of global environmental changes that would enable one to select the first priority directions in studies and
 to reliably assess the state of the nature society system NSS One of these priorities is to predict global climate change The
 growing interest in the problem of global climate change determined by its practical importance and by available contra
 dictory estimates of the anthropogenic contribution to climate change necessitates a systematization of knowledge of and
 data on the observed climate change and causes of this change Despite an enormous amount of projects and programmes of
 studies of past and present climatic trends the problem of reliable prediction of future climate change remains far from being
 solved Emissions to the atmosphere of greenhouse gases GHGs mainly carbon dioxide is considered as one of the main
 causes of an expected climate warming resulting in sufficiently negative consequences for humankind Therefore an attempt
 has been made in this book to construct a formalized technology to assess the level of the greenhouse effect due to
 anthropogenic sources of carbon dioxide as well as the effects of other gas components
