

8.3 WOOD STRUCTURES

8.3.1 Material and Treatment

The material and treatment of wood members should satisfy the requirements of Section 10 in IEEE 751 (1991), using the applicable standard listed under Section 10.2.2.

8.3.2 Manufacturing and Fabrication

The manufacturing and fabrication of wood members should satisfy the requirements of Section 10.1.4 of IEEE 751 (1991). Any special fabrication details or tolerances should be included by the purchaser in a purchase specification.

8.3.3 Inspection

The inspection of wood members should satisfy the requirements of AISC 200 (2004).

8.4 SHIPPING

At a minimum, the fabricator should comply with the shipping procedures as listed below:

- Check packaging to minimize shipping damage.
- Check items to ensure that they have completed specified inspections.
- Check that specified items are included with the shipment.

Before the start of fabrication, the purchaser should review the fabricator's methods and procedures for packaging and shipping and agree to the mode of transportation. When receiving materials, all products should be inspected for shipping damage before accepting delivery. If damage is apparent, the purchaser should immediately notify the delivering carrier. If the shipments are for on board (FOB) destination, the shipper is responsible for damage repair. Therefore, the purchaser should notify the fabricator of any damage and then cooperate in filing damage claims with the carrier.

When receiving materials, the purchaser is also responsible for checking to see that all materials listed on the packing lists were delivered. Where a discrepancy exists, both the carrier and the fabricator should be notified.

8.7 HANDLING AND STORAGE

The fabricator should provide written procedures for handling and storing materials to prevent damage, loss, or deterioration of the structure. The purchaser should review and approve these procedures before it shipment of any materials.

At a minimum, stored material should be placed on skids, platforms, or other supports above the ground and away from any vegetation. Decaying or decaying material supports should not be permitted to remain under stored material. Special care should be exercised while storing materials. Materials such as steel and aluminum stored within an energized substation, on nonconducting material, can develop an induced electric potential, and proper precautions should be used for worker safety. Proper initial placement of material sections can increase the efficiency of the final assembly process. Material identification marks should be visible when the material is stacked and should remain legible for the period of time specified by the purchaser.

P. Bažant, Luigi Cedolin, 2010 A crucial element of structural and continuum mechanics stability theory has limitless applications in civil mechanical aerospace naval and nuclear engineering This text of unparalleled scope presents a comprehensive exposition of the principles and applications of stability analysis It has been proven as a text for introductory courses and various advanced courses for graduate students It is also prized as an exhaustive reference for engineers and researchers The authors focus on understanding of the basic principles rather than excessive detailed solutions and their treatment of each subject proceed from simple examples to general concepts and rigorous formulations All the results are derived using as simple mathematics as possible Numerous examples are given and 700 exercise problems help in attaining a firm grasp of this central aspect of solid mechanics The book is an unabridged republication of the 1991 edition by Oxford University Press and the 2003 edition by Dover updated with 18 pages of end notes Wind Tunnel Testing of High-Rise Buildings Peter Irwin, Roy Denoon, David Scott, 2013-06-19 Since the 1960s wind tunnel testing has become a commonly used tool in the design of tall buildings It was pioneered in large part during the design of the World Trade Center Towers in New York Since those early days of wind engineering wind tunnel testing techniques have developed in sophistication but these techniques are not widely understood by the designers using the results As a direct result the CTBUH Wind Engineering Working Group was formed to develop a concise guide for the non specialist The primary goal of this guide is to provide an overview of the wind tunnel testing process for design professionals This knowledge allows readers to ask the correct questions of their wind engineering consultants throughout the design process This is not an in depth guide to the technical intricacies of wind tunnel testing it focusses instead on the information the design community needs including a unique methodology for the presentation of wind tunnel results to allow straightforward comparison of results from different wind tunnel laboratories advice on when a tall building is likely to be sufficiently sensitive to wind effects to benefit from a wind tunnel test background for assessing whether design codes and standards are applicable details of the types of tests that are commonly conducted descriptions of the fundamentals of wind climate and the interaction of wind and tall buildings This unique book is an essential guide for all designers of tall buildings and anyone else interested in the process of wind tunnel testing for tall buildings **Wind Loading of Structures** John D. Bulletin 73 Tall Buildings is the result of a collaboration between the fib and MPA The Concrete Centre UK Task Group 1 6 High rise buildings within fib Commission 1 Structures was drawn together with a mandate to write about the experience and know how pertinent to the development design and construction of tall concrete buildings The group s findings are presented in this state of the art report Tall buildings are a unique challenge to engineers even to those with extensive experience of low rise structures The bulletin explains the critical interfaces with other professionals for example architects building services engineers facade and lift specialists geotechnical engineers and wind specialists highlighting how these parties interact with engineers and can influence and guide the development of the structural solution The key factors in choosing the most appropriate structural system are discussed The bulletin covers the criteria used to select the most economical structural elements including the foundations the vertical elements and the floor slabs Examples of common construction methods are presented and their effects on the structural engineering design are discussed Tall buildings can undergo significant deformation during their construction and service life These movements need to be understood by the designer and potentially compensated for in the design and during construction One of the main particularities of the design of tall buildings is the dominance of the lateral loading from wind and seismic actions The bulletin provides a discussion of these important topics and sets out the current approach taken by experienced engineers Designers of tall buildings also need to understand the dynamic behaviour of the structure and confine the motion of the building to within acceptable limits Approaches to damping and dynamic performance are discussed and guidance provided on the appropriate occupant comfort limits
