Elements of General Chemistry Jay A. Young, 1960 [Scientific and Technical Aerospace Reports](#), 1986 **Organometallic Mechanisms and Catalysis** Jay Kochi, 2012-12-02 Organometallic Mechanisms and Catalysis The Role of Reactive Intermediates in Organic Processes covers the mechanistic delineation of organometallic chemistry and catalysis This book is organized into three parts encompassing 18 chapters The first part describes first the oxidation reduction process of organometals followed by discussions on the catalytic reactions of peroxides metal catalyzed addition to olefins and reduction of organic halides This part also explores other reactions involving transition metal carbonyls and metal catalyzed reactions of aromatic diazonium salts The second part deals with some chemical aspects of organometals such as their stability thermochemistry decomposition hemolytic pathways and the formation of carbon carbon bonds The third part examines the charge transfer processes and interactions of organometals with electron acceptors This part further looks into the cleavage and insertion reactions of organometals with electrophiles as well as the electrophilic and electron transfer mechanisms of organometals Organic and inorganic chemists teachers and students will greatly benefit from this book **Homogeneous Hydrogenation in Organic Chemistry** F.J. McQuillin, 2012-12-06 Organic chemistry is constantly concerned with effecting reactions at a particular centre in a complex molecule and if possible with a high and predictable level of stereoselectivity In the light of much accumulated experience within organic chemistry it is usually possible to assess the likelihood of alternative reaction pathways at least qualitatively However well based expectations can be falsified and the experiments directed to the synthesis of vitamin B12 which led to Woodward s recognition of orbital symmetry control in organic chemistry are an instructive example Our limitations in this respect are very much accentuated in the case of heterogeneous reactions which present additional problems and except for very well studied instances heterogeneous catalysis has

remained a relatively empirical area of chemistry Knowledge in this area has however been greatly improved by the development of transition metal complexes which replicate the catalytic properties of the metals and are effective in a homogeneous reaction system This development has advanced our understanding of catalysis by making it possible to interpret reactions in strictly molecular terms In addition these homogeneously active complexes are frequently more selective than their heterogeneous metallic counterparts either in discriminating between different functional centres in a molecule or in offering better stereoselectivity Homogeneous catalysts have now been devised for a number of organic chemical reactions including hydrogenation carbonylation polymerisation and isomerisation and dismutation of alkenes
