INVERSE TIME OVERCURRENT AND EARTH FAULT RELAY

Types CDG11 & 16

The type CDG11 relay is a heavily damped induction disc unit with an inverse definite minimum time/current characteristic. The relay gives selective phase and earth fault overcurrent protection in time-graded systems to transformers, a.c. machines and feeders, etc., and ensures that a minimum number of circuit breakers are tripped to clear a faulted section (see Application Sheet MS/5087).

The operating coil is wound to give time/current curves of the same shape on each of seven current taps which are selected by a plug setting bridge. The highest current tap is automatically selected when the plug is removed, so that adjustments can be made on load without open-circuiting the current transformer.

The relay has a high torque movement to ensure consistent timing even under adverse conditions, and a low burden and overshoot. Adjustment of the time setting is made by rotating a knurled moulded disc against a graduated time multiplier scale.

A high set overcurrent unit (type CAG) can be fitted in the same case to provide instantaneous protection under maximum short circuit conditions (see Application Sheet MS/5087).

The type CDG21 relay is either a double pole version (with two earth fault units or two overcurrent units) of the type CDG11, or a type CDG11 with an instantaneous unit.

The type CDG31 relay is a triple pole version (with three overcurrent units or two overcurrent units and one earth fault unit in the centre) of the type CDG11.
