power. This type of unit does not require a vacuum reservoir.

The Bendix Power Brake Unit can be identified by the twist-lock method of attaching the housing and cover together.

The basic elements of the vacuum unit are as follows:

A mechanically actuated control valve integral with the vacuum power diaphragm, controls the degree of power brake application or release in accordance with the foot pressure applied to the valve operating rod through the brake pedal linkage.

The control valve is a single poppet type valve with the atmospheric port and a vacuum port. The vacuum port seal is a part of the valve body attached to the

diaphragm assembly. The atmospheric port is a part of the valve plunger which moves within the valve housing and vacuum power diaphragm assembly.

A hydraulic master cylinder which contains all of the elements of the standard brake master cylinder except for the special hydraulic push rod which is a part of the power brake.

The unit is mounted to a ninety degree bracket which is mounted to the dash panel on models with a 5 in. (127mm) tandem booster (Fig. 1) and directly to the dash panel on all other models (Fig. 2).

When pressure is applied to the brake pedal it is transmitted through a bellcrank push rod to a hub and bellcrank assembly and in turn to the power brake unit.
