enterprises from pro market reforms The formation of the national car project marks a turning point for Malaysia s industrial development as a country which it envisions will lead to it becoming a major player in the global automotive market However the domestic institutional factors embedded in ethno economic interests and patronage constrain national car makers limiting their potential to grow and instead causing a slowdown in the industry Allowing readers to understand the background to Malaysia s heavy industrialisation programme and the birth of its national car projects this book critically discusses the significance of institutional context in policy outcomes and highlights how institutions and policies have impact growth or decline It is a valuable resource relevant to analysts researchers and students who are interested in the political economy of the national industrial policy and automotive industry in Malaysia and beyond *Automotive Empire* Andrew Denning,2024-07-15 Winner of the 2025 Nicolas Joseph Cugnot Award In *Automotive Empire* Andrew Denning uncovers how roads and vehicles began to transform colonial societies across Africa but rarely in the manner Europeans expected Like seafaring ships and railroads automobiles and roads were more than a mode of transport they organized colonial spaces and structured the political economic and social relations of empire both within African colonies and between colonies and the European metropole European officials in French Italian British German Belgian and Portuguese territories in Africa shared a common challenge the transport problem While they imagined that roads would radiate commerce and political hegemony by collapsing space the pressures of constructing and maintaining roads rendered colonial administration thin ineffective and capricious Automotive empire emerged as the European solution to the transport problem but revealed weakness as much as it extended power As *Automotive Empire* reveals motor vehicles and roads seemed the ideal solution to the colonial transport problem They were cheaper and quicker to construct than railroads overcame the environmental limitations of rivers and did not depend on the recruitment and supervision of African porters At this pivotal moment of African colonialism when European powers transitioned from claiming territories to administering and exploiting them automotive empire defined colonial states and societies along with the brutal and capricious nature of European colonialism itself Theory and Practice of Model Transformations Davide Di Ruscio,Dániel Varró,2014-07-05 This book constitutes the refereed proceedings of the 7th International Conference on Model Transformation ICMT 2014 held in York UK in July 2014 The 14 revised papers were carefully selected from 38 submissions The papers have been organized in topical sections on model transformation testing foundations of model synchronization applications of model synchronization and tracing and reverse engineering of transformations **200 technical questions and answers for job interview Offshore Oil & Gas Rigs** Petrogav International Oil & Gas Training Center,2020-06-30 The job interview is probably the most important step you will take in your job search journey Because it s always important to be prepared to respond effectively to the questions that employers typically ask at a job interview Petrogav International has prepared this eBooks that will help you to get a job in oil and gas industry Since these questions are so common hiring managers will expect you to be able to answer them smoothly and

Important Factors for Accurate Scale-Resolving Simulations of Automotive Aerodynamics Petter Ekman, 2020-04-02 Road transports are responsible for almost 18 % of the greenhouse gas emission in Europe and are today the leading cause of air pollution in cities Aerodynamic resistance has a significant effect on fuel consumption and hence the emission of vehicles For electric vehicles emissions are not affected by the aerodynamics as such but instead have a significant effect on the effective range of the vehicle In 2017 a new measurement procedure was introduced Worldwide Harmonized Light Vehicles Test Procedure WLTP for measuring emissions fuel consumption and range This procedure includes a new test cycle with increased average driving speed compared to the former procedure which thereby increases the importance of the aerodynamic resistance as it

drastically increases with speed A second effect is that the exact car configuration sold to the customer needs to be certified in terms of fuel consumption and emissions The result is that every possible combination of optional extras which might affect the aerodynamic resistance needs to be aerodynamically analyzed and possibly improved From 2021 the European Commission will introduce stricter emission regulations for new passenger cars with the fleet wide average lowered to 95 grams CO₂ km which puts an even higher demand on achieving efficient aerodynamics Virtual development of the aerodynamics of road vehicles is today used to a great extent using Computational Fluid Dynamics as it enables faster and cheaper development However achieving high accuracy for the prediction of the flow field and aerodynamic forces is challenging especially given the complexity of both the vehicle geometry in itself and the surrounding flow field Even for a simplified generic bluff body accurately predicting the flow field and aerodynamic forces is a challenge The main reason for this challenge of achieving results with high accuracy is the prediction of the complex behavior of turbulence Scale resolving simulation SRS methods such as Large Eddy Simulation LES where most of the turbulent structures are resolved has in many studies shown high accuracy but unfortunately to a very high computational cost It is primarily the small turbulent structures within the near wall region that requires a fine resolution in both space the mesh and in time This fine resolution is the reason for the very high computational cost and makes LES unfeasible for practical use in industrial aerodynamic development at present and in the near future By modeling the turbulent structures within the near wall region using a Reynolds Averaged Navier Stokes RANS model and resolving the turbulence outside the region with a LES model a coarser resolution is possible to use resulting in significantly lower computational cost Which used RANS model is of high importance and especially how much turbulent viscosity the model generates as too high values can result in suppression of the resolved turbulence The transitioning between the RANS and LES regions have a significant effect on the results Faster transition enables more resolved turbulence favorable for higher accuracy but needs to be balanced with sufficient shielding of the RANS region If resolving the turbulence occurs within the near wall region and the mesh is not sufficiently fine it can result in poor accuracy By increasing the time step size and disregarding best practice guides the computational cost can be significantly reduced The accuracy is reasonably insensitive to the larger time step sizes until a certain degree thereby enabling computationally cheaper SRS to achieve high accuracy of aerodynamic predictions needed to meet present and future emission regulations
