Mathematics for Healthcare Krasimira Tsaneva-Atanasova,Vanessa Diaz-Zuccarini,2018-09-28 In 1996 and with extraordinary prescience Panfilov and Holden had highlighted in their seminal book Computational Biology of the Heart that biology was potentially the most mathematical of all sciences Fast forward 20 years and we have seen an explosion of applications of mathematics in not only biology but healthcare that has already produced significant breakthroughs not imaginable more than 20 years ago Great strides have been made in explaining through quantitative methods the underlying mechanisms of human disease not without considerable ingenuity and effort Biological mechanisms are bewildering complex ever evolving multi scale variable difficult to fully access and understand This poses immense challenges to the computational physiology community that nevertheless has developed an impressive arsenal of tools and methods in a vertiginous race to combat disease with the tall order of improving human healthcare Mechanistic models are now contending with the advent of machine learning in healthcare and the hope is that both approaches will be used synergistically since the complexity of human patophysiology and the difficulty of acquiring human datasets will require both deductive and inductive methods This Research Topic presents work that is currently at the frontier in computational physiology with a striking range of applications from diabetes to graft failure and using a multitude of mathematical tools This collection of articles represents a snapshot in a field that is moving at a dizzying speed bringing understanding of fundamental mechanism and solutions to healthcare problems experienced by healthcare systems all over the world

Materials Discovery and Design Turab Lookman,Stephan Eidenbenz, Frank Alexander,Cris Barnes,2018-09-22 This book addresses the current status challenges and future directions of data driven materials discovery and design It presents the analysis and learning from data as a key theme in many science and cyber related applications The challenging open questions as well as future directions in the application of data science to materials problems are sketched Computational and experimental facilities today generate vast amounts of data at an unprecedented rate The book gives guidance to discover new knowledge that enables materials innovation to address grand challenges in energy environment and security the clearer link needed between the data from these facilities and the theory and underlying science The role of inference and optimization methods in distilling the data and constraining predictions using insights and results from theory is key to

achieving the desired goals of real time analysis and feedback Thus the importance of this book lies in emphasizing that the full value of knowledge driven discovery using data can only be realized by integrating statistical and information sciences with materials science which is increasingly dependent on high throughput and large scale computational and experimental data gathering efforts This is especially the case as we enter a new era of big data in materials science with the planning of future experimental facilities such as the Linac Coherent Light Source at Stanford LCLS II the European X ray Free Electron Laser EXFEL and MaRIE Matter Radiation in Extremes the signature concept facility from Los Alamos National Laboratory These facilities are expected to generate hundreds of terabytes to several petabytes of in situ spatially and temporally resolved data per sample The questions that then arise include how we can learn from the data to accelerate the processing and analysis of reconstructed microstructure rapidly map spatially resolved properties from high throughput data devise diagnostics for pattern detection and guide experiments towards desired targeted properties The authors are an interdisciplinary group of leading experts who bring the excitement of the nascent and rapidly emerging field of materials informatics to the reader

Basic Algebraic Topology and its Applications Mahima Ranjan Adhikari, 2016-09-16 This book provides an accessible introduction to algebraic topology a field at the intersection of topology geometry and algebra together with its applications Moreover it covers several related topics that are in fact important in the overall scheme of algebraic topology Comprising eighteen chapters and two appendices the book integrates various concepts of algebraic topology supported by examples exercises applications and historical notes Primarily intended as a textbook the book offers a valuable resource for undergraduate postgraduate and advanced mathematics students alike Focusing more on the geometric than on algebraic aspects of the subject as well as its natural development the book conveys the basic language of modern algebraic topology by exploring homotopy homology and cohomology theories and examines a variety of spaces spheres projective spaces classical groups and their quotient spaces function spaces polyhedra topological groups Lie groups and cell complexes etc The book studies a variety of maps which are continuous functions between spaces It also reveals the importance of algebraic topology in contemporary mathematics theoretical physics computer science chemistry economics and the biological and medical sciences and encourages students to engage in further study

Metaphysics of States of Affairs Bo R. Meinertsen, 2019-04-06 This book addresses the metaphysics of Armstrongian states of affairs i.e. instantiations of naturalist universals by particulars The author argues that states of affairs are the best candidate for truthmakers and in the spirit of logical atomism that we need no molecular truthmakers for positive truths In the book's context this has the pleasing result that there are no molecular states of affairs Following this account of truthmaking the author first shows that the particulars in first order states of affairs are bare particulars He then argues that the properties in states of affairs are simple non relational and concrete universals Next he argues that material relations in states of affairs are external relations Lastly he argues that a state of affairs is unified by a distinctive formal relation without giving rise to Bradley's regress Written in a relatively non technical style the book offers a valuable resource for philosophers working on analytic metaphysics and ontology as well as their graduate students

The Clinical and Ethical Practice of Neuromodulation - Deep Brain Stimulation and Beyond Markus Christen, Sabine Müller, 2018-01-15 Neuromodulation is among the fastest growing areas of medicine involving many diverse specialties and affecting hundreds of thousands of patients with numerous disorders worldwide It can briefly be described as the science of how electrical chemical and mechanical interventions can modulate the nervous system function A prominent example of neuromodulation is deep brain stimulation DBS an intervention that reflects a fundamental shift in the understanding of neurological and psychiatric

diseases namely as resulting from a dysfunctional activity pattern in a defined neuronal network that can be normalized by targeted stimulation The application of DBS has grown remarkably and more than 130 000 patients worldwide have obtained a DBS intervention in the past 30 years most of them for treating movement disorders This Frontiers Research Topics provides an overview on the current discussion beyond basic research in DBS and other brain stimulation technologies Researchers from various disciplines who are working on broader clinical ethical and social issues related to DBS and related neuromodulation technologies have contributed to this research topic
