Asthma: the Neglected Impact of Existing Public Health Interventions David Michael Patrick,Stuart Turvey,Meghan B. Azad,Petra Zimmermann,Angela Dramowski,Hannah Lishman,2025-06-10 Increasing evidence mainly in high income settings where data are often more readily available is showing that antibiotic exposure in early life increases the risk of developing asthma and other allergic conditions likely due to disturbances in the infant s gut microbiome during a foundational time of immunological development thereby predisposing the infant to hyperreactive immunological responses The method of infant feeding in these first few months of life is a crucial factor to consider as early evidence shows not only that breastmilk is optimal for growth lung development and passive immunological protection it also can act to restore healthy microbial growth in the infant s gut potentially reversing the risk of atopic disease While indoor and outdoor air pollution is a known trigger for asthmatic episodes in children its role extends to also disrupting the gut microbiome in the first months of life predisposing infants to asthma and allergy later in childhood Strong antibiotic stewardship promotion of and support for

breastfeeding and improved air quality inside and outside of the home are each vital public health efforts in and of themselves to reduce the urgent problem of antibiotic resistance promote healthy development and immunological protection in children and reduce respiratory and cardiovascular disease in the general population respectively However the additional benefit that they could confer in infants by protecting a healthy and diverse gut microbiome could contribute to reversing the asthma and allergy epidemic seen globally in the last several decades This reversal is starting to be seen in high income settings however the causal link is not conclusive and more research in animal models and at the population level needs to be done to understand these complex and interplaying early determinants of health The context specific challenges related to settings where antibiotic stewardship is less apparent breastfeeding is not well supported and or air quality is poor need to be understood And the policy and cost implications of realizing a potentially enormous additional benefit to existing public health programs need to be analyzed in order to make the case for public health investment where it will be most meaningful
