System-Ergonomic Design of Cognitive Automation Reiner Onken,Axel Schulte,2010-01-06 Why this book Simply because it is due Cognitive automation and its system ergonomic introduction into work systems have been advanced in the meantime to such a degree that already applications for operational work systems are slowly becoming reality This book shall contribute to give system designers some more guidelines about designing work systems and associated cognitive machines effectively in particular those related to guidance and control of manned and unmanned vehicles The issue is that the findings on cognition have to become sufficient commonsense for all from the various disciplines involved in system design and that guidelines are given how to make use of it in an appropriate and systematic manner These guidelines are to account for both the needs of the human operator in the work process and the use of computational potentials to make the work system a really most effective one In other words this book is meant to provide guidelines for the organisational and technical design of work systems Therefore this book is an interdisciplinary one Findings in individual disciplines are not the main issue It is rather the combination of these findings for the sake of the performance of work systems which makes this book a useful one for designers who are interested in this modern approach and its implementation

Human Factors Methods Neville Stanton,Paul M. Salmon,Laura A.  The advent of very compact very powerful digital computers has made it possible to automate a great many processes that formerly required large complex machinery Digital computers have made possible revolutionary changes in industry

commerce and transportation This book an expansion and revision of the author s earlier technical papers on this subject describes the development of automation in aircraft and in the aviation system its likely evolution in the future and the effects that these technologies have had and will have on the human operators and managers of the system It suggests concepts that may be able to enhance human machine relationships in future systems The author focuses on the ability of human operators to work cooperatively with the constellation of machines they command and control because it is the interactions among these system elements that result in the system s success or failure whether in aviation or elsewhere Aviation automation has provided great social and technological benefits but these benefits have not come without cost In recent years new problems in aircraft have emerged due to failures in the human machine relationship These incidents and accidents have motivated this inquiry into aviation automation Similar problems in the air traffic management system are predicted as it becomes more fully automated In particular incidents and accidents have occurred which suggest that the principle problems with today s aviation automation are associated with its complexity coupling autonomy and opacity These problems are not unique to aviation they exist in other highly dynamic domains as well The author suggests that a different approach to automation called human centered automation offers potential benefits for system performance by enabling a more cooperative human machine relationship in the control and management of aircraft and air traffic **Flying Magazine** ,1992-11 *Report on the Interfaces Between Flightcrews and Modern Flight Deck Systems* United States.
