Abstract

- [illegible]

Abstract The purpose of this study was to examine the effects of a 12-week, low-intensity, supervised walking program on the health-related quality of life (HRQL) of older adults with chronic low back pain (CLBP). The study was a randomized, controlled trial. The study population consisted of 100 older adults with CLBP, who were randomly assigned to either a supervised walking program or a control group. The walking program consisted of 12 weeks of supervised walking, 3 times per week, for 30 minutes per session. The control group received no intervention. The primary outcome measure was the SF-36 Health Survey, which assesses HRQL. The secondary outcome measures were the Oswestry Disability Index (ODI) and the Visual Analog Scale (VAS) for pain. The results showed that the walking program had a significant positive effect on HRQL, ODI, and VAS compared to the control group. The walking program was well-tolerated and had no adverse effects. The findings suggest that a supervised walking program may be a beneficial intervention for older adults with CLBP.
