previous generation. As a result, the demand for mobile information services with high reliability, fast response times, and ubiquitous connectivity continues to increase rapidly. The optimization of system performance has become critically important both in terms of practical utility and commercial viability and presents a rich area for research. In the editors' previous work on traditional wired networks, we have observed that designing low-cost survivable telecommunication networks involves extremely complicated processes. Commercial products available to help with this task typically have been based on simulation and/or proprietary heuristics. As demonstrated in this book, however, mathematical programming deserves a prominent place in the designer's toolkit. Convenient modeling languages and powerful optimization solvers have greatly facilitated the implementation of mathematical programming theory into the practice of commercial network design. These points are equally relevant and applicable in today's world of wireless network technology and design. But there are new issues as well. Many wireless network design decisions, such as routing and facility element location, must be dealt with in innovative ways that are unique and distinct from wired fiber optic networks. The book specifically treats the recent research and the use of modeling languages and network optimization techniques that are playing particularly important and distinctive roles in the wireless domain.

Fixed Mobile Convergence Handbook Syed A. Ahson, Mohammad Ilyas, 2018-09-03

Requirements for next-generation networks (NGNs) are fueling an architectural evolution. Service providers are obliged to give users access to content anytime, anywhere, on any device. This requires a converged infrastructure in which users across multiple domains can be served through a single unified domain, and all network services and business units can be consolidated on a single IP infrastructure. The Fixed Mobile Convergence Handbook is a comprehensive guide to the design, implementation, and management of converged cellular, Wi-Fi, wireless networks. This book discusses how FMC is transforming technologies as multimedia ceases to be passively consumed and unidirectional and becomes increasingly mobile, personalized, and interactive. This book also describes ways to ensure that networks remain cost-effective, scalable, reliable, and secure in the face of constant technological evolution. This material encapsulates the state of FMC, covering everything from basic concepts to research-grade material and future directions. Addressing a broad range of topics, the handbook consists of 16 chapters authored by 44 experts from around the world. Subjects include femtocell network technology and applications, deployment modes, and interference avoidance; architecture for power efficiency; conversational quality and network planning; design of SIP-based mobility management protocols. Highly respected in their field, the authors anticipate the key issues and problems that FMC presents from application inception and deployment to system interconnection and Quality of Service (QoS). Ideal for professional mobile technology designers and/or planners, researchers, faculty members, and graduate students, this book provides specific, salient features and information that will guide innovation in the 21st century and beyond. Syed Ahson is a senior software design engineer with Microsoft. Previously, he was a senior staff software engineer with Motorola, where he was a leading contributor in the creation of several iDEN, CDMA, and GSM cellular phones.

Dr Mohammad Ilyas is associate dean for research and industry relations at the College of Engineering and Computer Science at Florida Atlantic University Boca Raton A consultant to several national and international organizations Dr Ilyas is a member of both the IEEE and ASEE
