NJN ... Secondary Teacher Manual, Grades 7-12 ,1988 Echocardiographic Atlas of Adult Congenital Heart Disease Hakimeh Sadeghian,Zahra Savand-Roomi,2015-05-20 This atlas of echocardiography presents more than 100 cases of adult congenital heart disease from diagnosis to treatment follow up The coverage is broad encompassing atrial and ventricular septal defects patent ductus arteriosus cyanotic adult congenital heart disease and numerous other anomalies as well as findings on fetal echocardiography For each disease all echocardiographic images and views which proved of diagnostic value are arranged sequentially with inclusion of transesophageal echocardiographic images whenever appropriate Additional pertinent information is provided relating to diagnosis and treatment and key teaching points are highlighted The superb quality of the illustrations and the range of cases considered including many rare ones ensure that this atlas will be of great value for cardiology residents and fellows and highly relevant to day to day practice *Movement Disorders* Hubert H. Fernandez,Marcelo J. Merello,2013 Clinical case studies have long been recognized as a useful adjunct to problem based learning and continuing professional development This book collects over 90 of the most memorable and challenging movement disorder cases from the world s leading authorities in this specialty Compelling vignettes covering the entire phenomenology of movement disorders are presented succinctly but descriptively to walk the reader through the diagnostic process much like being in the examining room with a master clinician Each case follows a set format consisting of four sections The Case The Approach The Lesson Reference and Suggested Readings Imaging findings and other illustrations amplify the discussion where pertinent **Individual differences in associative learning** Robin A. Murphy,Rachel M. Msetfi,2014-09-24 Theories of associative learning have a long history in advancing the psychological account of behavior via cognitive representation There are many components and variations of associative theory but at the core is the idea that links or connections between stimuli or responses describe important aspects of our psychological experience This Frontiers Topic considers how variations in association formation can be used to account for differences between people elaborating the differences between males and females differences over the life span understanding of psychopathologies or even across cultural contexts A recent volume on the application of learning theory to clinical psychology is one example of this emerging application e g Hazelgrove Hogarth 2012 The task for students of learning has been the development often with mathematically defined explanations of the parameters and operators that determine the formation and strengths of associations The ultimate goal is to explain how the acquired representations influence future behavior This approach has recently been influential in the field of neuroscience where one such learning operator the error correction principle has unified the understanding of the conditions which facilitate neuron activation with the computational goals of the brain with properties of learning algorithms e g Rescorla Wagner 1972 In this Frontiers Research Topic we are interested in a similar but currently developing aspect to learning theory which is the application of the associative model to our understanding of

individual differences including psychopathology In general learning theories are monolithic the same theory applies to the rat and the human and within people the same algorithm is applied to all individuals If so this might be thought to suggest that there is little that learning theory can tell us about the how males and females differ how we change over time or why someone develops schizophrenia for instance However these theories have wide scope for developing our understanding of when learning occurs and when it is interfered with along with a variety of methods of predicting these differences We received contributions from researchers studying individual differences including sex differences age related changes and those using analog or clinical samples of personality and psychopathological disorders where the outcomes of the research bear directly on theories of associative learning This Research Topic brings together researchers studying basic learning and conditioning processes but in which the basic emotional attentional pathological or more general physiological differences between groups of people are modeled using associative theory This work involves varying stimulus properties and temporal relations or modeling the differences between groups
