context of today's mathematical and scientific research. This popular book blends both theory and application to equip the reader with an understanding of the basic principles necessary to apply regression model building techniques in a wide variety of application environments. It assumes a working knowledge of basic statistics and a familiarity with hypothesis testing and confidence intervals as well as the normal, t , and F distributions. Illustrating all of the major procedures employed by the contemporary software packages MINITAB, SAS, and SPSS, the Fourth Edition begins with a general introduction to regression modeling including typical applications. A host of technical tools are outlined such as basic inference procedures, introductory aspects of model adequacy checking, and polynomial regression models and their variations. The book discusses how transformations and weighted least squares can be used to resolve problems of model inadequacy and also how to deal with influential observations. Subsequent chapters discuss indicator variables and the connection between regression and analysis of variance models. Variable selection and model building techniques and strategies. The multicollinearity problem, its sources, effects, diagnostics, and remedial measures. Robust regression techniques such as M-estimators and properties of robust estimators. The basics of nonlinear regression. Generalized linear models. Using SAS for regression problems. This book is a robust resource that offers solid methodology for statistical practitioners and professionals in the fields of engineering, physical and chemical sciences, economics, management, life and biological sciences, and the social sciences. Symposium APNOMS 2009 which was held in Jeju Korea during September 23-25, 2009. Recently various convergences in wired and wireless networks and convergence of telecommunications and broadcastings are taking place for ubiquitous multimedia service provisioning. For example, broadband IP MPLS wired networks are actively converged with IEEE 802.11e wireless LAN, IEEE 802.16 Wireless MAN, 3G/4G wireless cellular networks, and direct multimedia broadcast DMB networks. For efficient support of service provisioning for ubiquitous multimedia services on the broadband convergence networks, well designed and implemented network operations and management functions with QoS guaranteed traffic engineering are essential. The converged network will open the way for a new world with emerging new businesses and computing services. The Organizing Committee (OC) selected "Management Enabling the Future Internet for Changing Business and New Computing Services" as the timely theme of APNOMS 2009. Contributions from academia, industry, and research institutions met these challenges with 173 paper submissions, from which 41 high quality papers (23.7% of the submissions) were selected for technical sessions as full papers, and 32 papers were selected as short papers. In addition, we had nine papers in innovation sessions for on-going research. Diverse topics were covered, including Traffic Trace Engineering, Configuration and Fault Management, Management of IP-Based Networks, Autonomous and Distributed Control, Sensor Network, and P2P Management, Converged Networks, and Traffic Engineering, SLA and QoS Management, Active and Security Management, Wireless and Mobile Network Management, and Security Management.
