Ahonen,2017-07-17 The deep subsurface is in addition to space one of the last unknown frontiers to human kind A significant part of life on Earth resides in the deep subsurface hiding great potential of microbial life of which we know only little The conditions in the deep terrestrial subsurface are thought to resemble those of early Earth which makes this environment an analog for studying early life in addition to possible extraterrestrial life in ultra extreme conditions Early microorganisms played a great role in shaping the conditions on the young Earth Even today deep subsurface microorganisms interact with their geological environment transforming the conditions in the groundwater and on rock surfaces Essential elements for life are richly present but in difficultly accessible form The elements driving the microbial deep life is still not completely identified Most of the microorganisms detected by novel molecular techniques still lack cultured representatives Nevertheless using modern sequencing techniques and bioinformatics the functional roles of these microorganisms are being revealed We are starting to see the differences and similarities between the life in the deep subsurface and surface domains We may even begin to see the function of evolution by comparing deep life to life closer to the surface of Earth Deep life consists of organisms from all known domains of life This Research Topic reveals some of the rich diversity and functional properties of the great biomass residing in the deep dark subsurface *Focus On: 100 Most Popular Station Wagons*

Micro-XRF Studies of Sediment Cores Ian W. Croudace, R. Guy Rothwell, 2015-07-21

This volume presents papers on the use of micro XRF core scanners in palaeoenvironmental research. It contains a broad ranging view of instrument capability and points to future developments that will help contribute to higher precision elemental data and faster core analysis. Readers will find a diverse range of research by leading experts that have used micro XRF core scanners in a wide range of scientific applications. The book includes specific application papers reporting on the use of XRF core scanners in a variety of marine, lacustrine, and pollution studies. In addition, coverage also examines practical aspects of core scanner usage, data optimisation, and data calibration and interpretation. In a little over a decade, micro XRF sediment core scanners have made a substantive contribution to palaeoenvironmental research. Their impact is based on their ability to rapidly, non-destructively, and automatically scan sediment cores. Not only do they rapidly provide important proxy data without damaging samples, but they can obtain environmental data at decadal, annual, and even sub-annual scales. This volume will help both experienced and new users of these non-destructive core scanners take full advantage of one of the most powerful geochemical screening tools in the environmental scientist's toolbox.
