

A detailed microscopic image of algal cells, likely from a green alga, showing a dense cluster of yellow-green, oval-shaped cells with dark, irregular cell walls. The cells are arranged in a somewhat organized pattern, with some larger cells and many smaller ones. The background is a solid black, which makes the yellow-green cells stand out prominently.

The Biology and Ecology of Giant Kelp Forests David R. Schiel, Michael S. Foster, 2015-05-01 The largest seaweed giant kelp *Macrocystis* is the fastest growing and most prolific of all plants found on earth Growing from the seafloor and extending along the ocean surface in lush canopies giant kelp provides an extensive vertical habitat in a largely two dimensional seascape It is the foundation for one of the most species rich productive and widely distributed ecological communities in the world Schiel and Foster's scholarly review and synthesis take the reader from Darwin's early observations to contemporary research providing a historical perspective for the modern understanding of giant kelp evolution biogeography biology and physiology The authors furnish a comprehensive discussion of kelp species and forest ecology worldwide with considerations of human uses and abuses management and conservation and the current and likely future impacts of global change This volume promises to be the definitive treatise and reference on giant kelp and its forests for many years and it will appeal to marine scientists and others who want a better appreciation and understanding of these wondrous forests of the sea

An Archaeology of Abundance Kristina M. Gill, Mikael Fauvelle, Jon M. Earlandson, 2019-01-23 This volume focuses on the archaeology and historical ecology of a series of islands located off the Pacific Coast of Alta and Baja California from the Channel Islands to Cedros Island

Interpretation and Implications of Variability in Ecological Systems Robert Klinger, Clare Aslan, Karen Thorne, 2024-07-22 Numerous hypotheses have been proposed to explain the dynamics in abundance of individual species how species interact how communities assemble and how interactions between biotic and abiotic processes shape ecosystem stability Many if not most of these hypotheses find some degree of support but often only within relatively narrow spatial and temporal ranges This is because conditions vary over time and from place to place and so the strength and extent of processes that were the focus of a given hypothesis become altered by other forces Ecologists have confronted variability from two perspectives conceptual and statistical Conceptually spatial and temporal variability are now recognized as being scale dependent and hierarchical Statistically there are many models that ecologists readily use that account for the hierarchical and scale dependence of variability present in many datasets But linking the two perspectives into a meaningful understanding of what variability means in real systems has been much less successful For example it is common to see studies where the fixed effects of a generalized linear mixed model are reported but very often random effects are completely ignored or at best given scant attention The likelihood of this being a significant problem increases greatly in what are rapidly becoming more common studies that utilize datasets spanning long temporal and or large spatial scales or when extreme and often unpredictable events gray and black swans occur

Phytoplankton Whispering: An Introduction to the Physiology and Ecology of Microalgae Patricia M.

Glibert,2024-08-12 Phytoplankton or algae are the engines of the Earth They form the base of the aquatic food web and although microscopic they produce 50% of the oxygen in the air Many of our ideas of what makes these cells tick come from ideas developed decades ago But lakes and oceans are changing and so too are phytoplankton Our understanding has to change accordingly Nutrient pollution is a major problem worldwide and climate is changing altering temperature CO₂ and pH as well as the physics that control water stratification All of these factors control which species of phytoplankton may grow well at any particular time While algae grow in all types of aquatic systems not all algae are favorable for the production of fish and other food resources The prevalence of harmful algal blooms HABs has increased At the core of this effort is a drive to understand and to convey to researchers students and managers what kinds of phytoplankton are likely to thrive as conditions change and why this matters There has not yet been a synthetic summary that unravels the mysteries of phytoplankton in a modern world This book aims to provide such a resource
