Advanced Topics in Bisimulation and Coinduction Davide Sangiorgi, Jan Rutten, 2011-10-13 Coinduction is a method for specifying and reasoning about infinite data types and automata with infinite behaviour In recent years it has come to play an ever more important role in the theory of computing It is studied in many disciplines including process theory and concurrency modal logic and automata theory Typically coinductive proofs demonstrate the equivalence of two objects by constructing a suitable bisimulation relation between them This collection of surveys is aimed at both

researchers and Master's students in computer science and mathematics and deals with various aspects of bisimulation and coinduction with an emphasis on process theory. Seven chapters cover the following topics: history, algebra and coalgebra, algorithmics, logic, higher order languages, enhancements of the bisimulation proof method and probabilities. Exercises are also included to help the reader master new material. 7th Conference on Algebra and Coalgebra in Computer Science Filippo Bonchi, Barbara König (teoretično računalništvo.), 2017 Algebra, Meaning, and Computation Kokichi Futatsugi, 2006-06-22 This volume honoring the computer science pioneer Joseph Goguen on his 65th Birthday includes 32 refereed papers by leading researchers in areas spanned by Goguen's work. The papers address a variety of topics from meaning, meta logic, specification and composition, behavior and formal languages as well as models, deduction and computation by key members of the research community in computer science and other fields connected with Joseph Goguen's work. **Logics for Coalgebras and Applications to Computer Science** Alexander Kurz, 2001-05 *Foundations of Software Science and Computation Structures* Mogens Nielsen, Uffe Engberg, 2003-08-01 ETAPS 2002 is the fifth instance of the European Joint Conferences on Theory and Practice of Software. ETAPS is an annual federated conference that was established in 1998 by combining a number of existing and new conferences. This year it comprises five conferences: FOSSACS, FASE, ESOP, CC, TACAS, thirteen satellite workshops, ACL2, AGT, CMCS, COCV, DCC, INT, LDTA, SC, SFEDL, SLAP, SPIN, TPTS and VISS, eight invited lectures not including those that are specific to the satellite events and several tutorials. The events that comprise ETAPS address various aspects of the system development process including specification, design, implementation, analysis and improvement. The languages, methodologies and tools which support these activities are all well within its scope. Different blends of theory and practice are represented with an inclination towards theory with a practical motivation on one hand and soundly based practice on the other. Many of the issues involved in software design apply to systems in general including hardware systems and the emphasis on software is not intended to be exclusive. **Algebraic and Coalgebraic Methods in the Mathematics of Program Construction** Roland Backhouse, Roy Crole, Jeremy Gibbons, 2003-07-31 Program construction is about turning specifications of computer software into implementations. Recent research aimed at improving the process of program construction exploits insights from abstract algebraic tools such as lattice theory, fixpoint calculus, universal algebra, category theory and allegory theory. This textbook-like tutorial presents besides an introduction eight coherently written chapters by leading authorities on ordered sets and complete lattices, algebras and coalgebras, Galois connections and fixed point calculus, calculating functional programs, algebra of program termination, exercises in coalgebraic specification, algebraic methods for optimization problems and temporal algebra.
