Boswell,Ruhul Amin Sarker,2021-11-13 This book consists of eight chapters authored by distinguished researchers and practitioners that highlight the state of the art and recent trends in addressing the project portfolio selection and scheduling problem PPSSP across a variety of domains particularly defense social programs supply chains and finance Many organizations face the challenge of selecting and scheduling a subset of available projects subject to various resource and operational constraints In the simplest scenario the primary objective for an organization is to maximize the value added through funding and implementing a portfolio of projects subject to the available budget However there are other major difficulties that are often associated with this problem such as qualitative project benefits multiple conflicting objectives complex project interdependencies workforce and manufacturing constraints and deep uncertainty regarding project costs benefits and completion times It is well known that the PPSSP is an NP hard problem and thus there is no known polynomial time algorithm for this problem Despite the complexity associated with solving the PPSSP many traditional approaches to this problem make use of exact solvers While exact solvers provide definitive optimal solutions they quickly become prohibitively expensive in terms of computation time when the problem size is increased In contrast evolutionary and memetic computing afford the capability for autonomous heuristic approaches and expert knowledge to be combined and thereby provide an efficient means for high quality approximation solutions to be attained As such these approaches can provide near real time decision support information for

portfolio design that can be used to augment and improve existing human centric strategic decision making processes This edited book provides the reader with a broad overview of the PPSSP its associated challenges and approaches to addressing the problem using evolutionary and memetic computing
