Accelerations and Circular Motion

Newton's second law, $a = F/m$, tells us that net force and its corresponding acceleration are always in the same direction. (Only force-related accelerations are vector quantities.) But force and acceleration are not always in the direction of velocity (another vector).

1. You're in a car at a traffic light. The light turns green and the driver "rips on the gas."

- a. Your body lurches forward (not at all backward).
- b. The car accelerates forward (not at all backward).
- c. The force on the car acts forward (not at all backward).

The sketch shows the top view of the car. Note the directions of the velocity and acceleration vectors.

2. You're driving along and approach a stop sign. The driver rips on the brakes.

- a. Your body lurches backward (not at all forward).
- b. The car accelerates backward (not at all forward).
- c. The force on the car acts backward (not at all forward).

The sketch shows the top view of the car. Draw vectors for velocity and acceleration.

3. You continue driving, and round a sharp curve to the left at constant speed.

- a. Your body lurches backward (not at all forward).
- b. The direction of the car's acceleration is backward (not at all forward).
- c. The force on the car acts backward (not at all forward).

Draw vectors for velocity and acceleration of the car.

4. In general, the directions of lurch and acceleration, and therefore the directions of force and force, are the same (not related) opposite.

- a. The whirling stone's direction of motion keeps changing.
- b. If it moves faster, its direction changes faster (slower).
- c. This indicates that as speed increases, acceleration increases (decreases) (stays the same).
- d. For a given speed, the size that the stone changes direction is less smaller (larger).
- e. This indicates that as the radius decreases, acceleration decreases (increases) (stays the same).
