

Capacitance  $C = \frac{Q}{V}$

$$C = \frac{\epsilon_0 \epsilon_r A}{d}$$

→ area under graph = energy stored

$$E = \frac{1}{2} QV$$

$$E = \frac{1}{2} CV^2$$

$$E = \frac{1}{2} \frac{Q^2}{C}$$

### Capacitor charge and discharge

- In order to charge/discharge a capacitor you must connect it in a circuit with a power supply and resistor

When a capacitor is connected to a d.c power supply a current flows in the circuit until the capacitor is fully charged, then stops

Negative charge builds up on the plate connected to the negative terminal

On the other plate, electrons are repelled by the negative charge building up on the initial plate  $\Rightarrow$  so these electrons move to the positive terminal

→ an equal but opposite charge is formed on each plate

→ creating a potential difference

As charge across the plates increases  $\rightarrow$  p.d increases, but electron flow decreases due to force of electrostatic repulsion also increasing

$\therefore$  current decreases until it reaches zero  
→ as capacitor becomes fully charged

*Cardiovascular Physiology Concepts* Richard E. Klabunde, 2005 This uniquely readable, compact and concise monograph lays a foundation of knowledge of the underlying concepts of normal cardiovascular function. Students welcome the book's broad overview as a practical partner or alternative to a more mechanistically oriented approach or an encyclopedic physiology text. Especially clear explanations, ample illustrations, a helpful glossary of terms, tutorials and chapter opening learning objectives provide superb guidance for self directed learning and help fill the gap in many of today's abbreviated physiology blocks. A focus on well established cardiovascular principles reflects recent, widely accepted cardiovascular research. The supplemental CD ROM is an interactive, dynamically linked version of the book which is organized by normal cardiovascular function and cardiac disease.
