

7. Is the buoyant force on the submerged clay greater than, equal to, or less than its weight out of the water? What is your evidence?

Step 6: Retrieve the clay from the bottom, and mold it into a shape that allows it to float. Sketch or describe this shape. Measure the volume of water displaced by the floating clay. Calculate the mass of the water, and record in Table A.

Data:

Table A

Object	Mass (g)	Volume of water displaced (mL)	Mass of water displaced (g)
Wood	100g	100 mL	100 g
Wood + 100 200-g mass	200g	200 mL	200 g
Clay ball 40g	40g	40 mL	40 g
Floating clay 40g	40g	35 mL	35 g

Going Further

Step 7: Suppose you are on a ship in a canal lock. If you throw a ton of lead bricks overboard from the ship into the canal lock, will the water level in the canal lock go up, down, or stay the same? Write down your prediction before you proceed to Step 8.

Prediction for water level in canal lock: water level downward

Step 8: Float a toy boat loaded with lead "cargo" in a relatively deep container filled with water (deeper than the height of the lead masses). For observable results, the size of the container should be just slightly bigger than the boat. Mark and label the water levels on masking tape placed on the container and on the sides of the boat. Remove the masses from the boat and put them in the water. Mark and label the new water levels.

Summing Up

1. Does the clay displace more, less, or the same amount of water when it floats as it did when it sank?

The clay displace less amount of water when it floats as it did when it sank

2. Is the buoyant force on the floating clay greater than, equal to, or less than the weight of the clay?

The buoyant force on the floating clay is

3. What can you conclude about the weight of an object and the weight of water displaced by the object when it floats?

I can conclude that,

Modeling, Verification and Exploration of Task-Level Concurrency in Real-Time Embedded Systems Filip Thoen, Francky Catthoor, 2012-12-06 system is a complex object containing a significant percentage of electronics that interacts with the Real World physical environments humans etc through sensing and actuating devices A system is heterogeneous i e is characterized by the co existence of a large number of components of disparate type and function for example programmable components such as micro processors and Digital Signal Processors DSPs analog components such as A/D and D/A converters sensors transmitters and receivers Any approach to system design today must include software concerns to be

viable In fact it is now common knowledge that more than 70% of the development cost for complex systems such as automotive electronics and communication systems are due to software development In addition this percentage is increasing constantly It has been my take for years that the so called hardware software co design problem is formulated at a too low level to yield significant results in shorten ing design time to the point needed for next generation electronic devices and systems The level of abstraction has to be raised to the Architecture Function co design problem where Function refers to the operations that the system is supposed to carry out and Architecture is the set of supporting components for that functionality The supporting components as we said above are heteroge neous and contain almost always programmable components
