Introductions to Applied Linguistics is a series of introductory level textbooks covering the core topics in Applied Linguistics primarily designed for those beginning postgraduate studies or taking an introductory MA course as well as advanced undergraduates. Titles in the series are also ideal for language professionals returning to academic study. The books take an innovative practice to theory approach with a back to front structure. This leads the reader from real world problems and issues through a discussion of intervention and how to engage with these concerns before finally relating these practical issues to theoretical foundations. Additional features include tasks with commentaries, a glossary of key terms and an annotated further reading section.

Biological Fixation of Nitrogen for Ecology and Sustainable Agriculture Andrzej Legocki, Hermann Bothe, Alfred Pühler, 2013-06-29. Biological nitrogen fixation (BNF) – the conversion of molecular nitrogen into ammonia – is one of the most important reactions in ecology and agriculture. It is performed exclusively by microbes (prokaryotes) that live in symbiosis with plants. This book summarizes the latest research on this reaction: the participating microbes and the genetics of how their relevant genes could be transferred into the plants. In the light of a more sustainable and less ecologically damaging agriculture, this is becoming an increasingly pressing issue.

Psychological Concepts and Biological Psychiatry Peter Zachar, 2000-01-01. This interdisciplinary work addresses the question: What role should psychological conceptualization play for thinkers who believe that the brain is the organ of the mind? It offers readers something unique both by systematically comparing the writings of eliminativist philosophers of mind with the writings of the most committed proponents of biological psychiatry and by critically scrutinizing their shared anti-anthropomorphism from the standpoint of a diagnostician and therapist. Contradicting the contemporary assumption that common sense psychology has already been proven futile and we are just waiting for an adequate scientifically based replacement, this book provides explicit philosophical and psychological arguments showing why, if they did not already have both cognitive and psychodynamic psychologies, philosophers and scientists would have to invent them to better understand brains.
