

P. Sci. Waves **Key**

Put all answers on a separate sheet of notebook paper.

1. Mechanical waves need a medium through which to transport energy.
2. The particles in a surface water wave move in a circle (back-&-forth / up & down).
3. Waves in which the particles of medium move at right angles to the direction of the wave are transverse waves.
4. The wavelength of a wave is measured from the crest of one wave to the crest of the next.
5. If the wavelength of a given wave decreases, you know that its frequency will increase.
6. Two waves have the same frequency and wavelength, but the first wave has a greater amplitude. The energy of the first wave greater than that of the second.
7. Wave A has a greater frequency than wave B, but the amplitude of the two waves is the same. The energy of wave A is equal to that of wave B.
8. The unit for frequency is the hertz.
9. A wave will travel only as long as it has energy to carry.
10. When you squeeze together the coils of a spring and then release them, you are creating a compressional wave.
11. Waves in which the particles of the medium move only in the same direction as the motion of the wave are compressional waves.
12. You are creating a wave on a spring. If you start shaking the spring more slowly, the wavelength of the resulting wave will increase.
13. If you are lying on a raft, and you notice that the number of waves that go past the raft increases, you also find that the distance between each crest decreases.
14. Wave A carries more energy than wave B. Wave B has a smaller amplitude than wave A.
15. The energy a wave carries is measured by its amplitude.
16. For a given wave, if the frequency doubles, the wavelength is halved.
17. When a wave passes from a less dense medium to a more dense medium, the speed may change.
18. Repeating disturbances that transfer energy through matter or space are waves.

19. The two types of mechanical waves are transverse and compressional (longitudinal).
20. If the frequency of a water wave changes, its wavelength must also change.
21. The symbol λ (lambda) stands for the wavelength.

Figure 11-1

22. In Figure 11-1, identify the following structures:
B wavelength, A crest, C amplitude
23. Speed can be determined by dividing the distance traveled by the time. The water waves in a lake travel 4.4 m in 2.0 s. What is the speed of the waves? $y = d/t$ $v = 4.4\text{m} / 2.0\text{s}$ $v = 2.2\text{ m/s}$
24. An ocean wave has a frequency of 2.0 Hz with a wavelength of 10 m. What is the velocity of the wave? $v = f \times \lambda$ $v = 2.0\text{ Hz} \times 10\text{ m}$
 $v = 20\text{ m/s}$

25. The wavelength of the wave in the diagram is 1.5 m.
26. The amplitude of the above wave is 0.5 m.
27. A man is standing on the shore of a beach, up to his knees in water. Every 5 seconds a wave breaks on him. What is the period of the wave? 5 seconds

Changing Concepts of the Nervous System Adrian Morrison, 2012-12-02 *Changing Concepts of the Nervous System* presents the proceedings of the First Institute of Neurological Sciences Symposium in Neurobiology held at the University of Pennsylvania in October 1980. The book is divided into four parts consisting of mini symposia on different aspects of the neurosciences. The first mini symposia discuss the anatomical, physiological, developmental, and behavioral plasticity of the nervous system. The second mini symposia cover the changing concepts of the central visual system. The idea of the biological basis of the concept of motivation and its behavioral manifestations from both theoretical and experimental aspects is examined in the third mini symposia. The final mini symposia tackle the four aspects of studies on memory, amnesia, consolidation, and retrieval: the role of catecholamines, the role of proteins, and the role of peptides. Anatomists, neurobiologists, neuroscientists, and students and researchers in the field of neuroscience will find the book invaluable. *Irregularities and Prediction of Major Disasters* Yi Lin, Shoucheng OuYang, 2010-03-18 Although scientists have effectively employed the concepts of probability to address the complex problem of prediction, modern science still falls short in establishing true predictions with meaningful lead times of zero probability for major disasters. The recent earthquakes in Haiti, Chile, and China are tragic reminders of the critical need for **Scientific Modeling and Simulations**. Sidney Yip, Tomas Diaz Rubia, 2010-04-07 Although computational modeling and simulation of material deformation was initiated with the study of structurally simple materials and inert environments, there is an increasing demand for predictive simulation of more realistic material structure and physical conditions. In particular, it is recognized that applied mechanical force can plausibly alter chemical reactions inside materials or at material interfaces. Though the fundamental reasons for this chemomechanical coupling are studied in a material specific manner, Atomistic level simulations can provide insight into the unit processes that facilitate kinetic reactions within complex materials, but the typical nanosecond timescales of such simulations are in contrast to the second scale to hour scale timescales of experimentally accessible or technologically relevant timescales. Further, in complex materials, these key unit processes are rare events due to the high energy barriers associated with those processes. Examples of such rare events include unbinding between two proteins that tether biological cells to extracellular materials, 1. unfolding of complex polymers, stiffness and bond breaking in amorphous glasses and gels, 2. and diffusive hops of point defects within crystalline alloys, 3.
