Acceleration and Circular Motion

Newton's second law, $a = F/m$, tells us that net force and its corresponding acceleration are always in the same direction. (Only force and acceleration are vector quantities.) But force and acceleration are not always in the direction of velocity (another vector).

1. You're in a car at a traffic light. The light turns green and the driver "pegs on the gas."

- Your body lurches **forward** (not at all **backward**).
- The car accelerates **forward** (not at all **backward**).
- The force on the car acts **forward** (not at all **backward**).

The sketch shows the top view of the car. Note the directions of the velocity and acceleration vectors.

2. You're driving along and approach a stop sign. The driver "pegs on the brakes."

- Your body lurches **backward** (not at all **forward**).
- The car accelerates **backward** (not at all **forward**).
- The force on the car acts **backward** (not at all **forward**).

The sketch shows the top view of the car. Draw vectors for velocity and acceleration.

3. You continue driving, and round a sharp curve to the left at constant speed.

- Your body lurches **inward** (not at all **outward**).
- The direction of the car's acceleration is **inward** (not at all **outward**).
- The force on the car acts **inward** (not at all **outward**).

Draw vectors for velocity and acceleration of the car.

4. In general, the directions of force and acceleration, and therefore the directions of force and force, are the same (not related) **opposite**.

- The string stone's direction of motion keeps changing.
 - If it moves faster, its direction changes **faster** (slower).
 - This indicates that as speed increases, acceleration **increases** (decreases) (stays the same).
- Consider whirling the stone on a shorter string—that is, of smaller radius.
 - For a given speed, the rate that the stone changes direction is **faster** (slower) like same.
 - This indicates that as the radius decreases, acceleration **increases** (decreases) (stays the same).
