

A major puzzle faced scientists in the 19th Century. Volcanoes showed that the Earth is molten beneath its crust. Penetration into the crust by bore holes and mines showed that the Earth's temperature increases with depth. Scientists knew that heat flows from the interior to the surface. They assumed that the source of the Earth's internal heat was primordial, the afterglow of its fiery birth. Measurements of cooling rates indicated a relatively young Earth—some 25 to 30 millions years in age. But geological evidence indicated an older Earth. This puzzle wasn't solved until the discovery of radioactivity. Then it was learned that the interior is kept hot by the energy of radioactive decay. We now know the age of the Earth is some 4.5 billions years—a much older Earth.

All rock contains trace amounts of radioactive minerals. Those in common granite release energy at the rate 0.03 J/kg y. Granite at the Earth's surface transfers this energy to the surroundings practically as fast as it is generated, so we don't find granite warm to the touch. But what if a sample of granite were thermally insulated? That is, suppose the increase of internal energy due to radioactivity were contained. Then it would get hotter. How much? Let's figure it out, using 790 joule/kilogram kelvin as the specific heat of granite.

Calculations to make:

- How many joules are required to increase the temperature of 1 kg of granite by 1000 K?
- How many years would it take radioactive decay in a kilogram of granite to produce this many joules?

✗
command

Questions to answer:

- How many years would it take a thermally insulated 1-kg chunk of granite to undergo a 1000 K increase in temperature?
- How many years would it take a thermally insulated one-million-kilogram chunk of granite to undergo a 1000 K increase in temperature?
- Why does the Earth's interior remain molten hot?
- Rock has a higher melting temperature deep in the interior. Why?
- Why doesn't the Earth just keep getting hotter until it all melts?
- True or false: The energy produced by Earth radioactivity ultimately becomes terrestrial radiation.

An electric toaster stays hot while electric energy is supplied, and doesn't cool until switched off. Similarly, do you think the earth hot will one day suddenly switch off like a disconnected toaster — or gradually decrease over a long time?
