

Chapter 29 Light Waves
Diffraction and Interference—continued

2. Look at the construction of overlapping circles on your classmates' papers. Some will have more nodal lines than others, due to different starting points. How does the number of nodal lines in a pattern relate to the distance between centers of circles (or sources of waves)?

3. Figure 29.18 from your textbook is repeated below. Carefully count the number of wavelengths (same as the number of wave crests) along the following paths between the slits and the screen.

- a. Number of wavelengths between slit A and point a is _____
 b. Number of wavelengths between slit B and point a is _____
 c. Number of wavelengths between slit A and point b is _____
 d. Number of wavelengths between slit B and point b is _____
 e. Number of wavelengths between slit A and point c is _____
 f. Number of wave crests between slit B and point c is _____

4. When the number of wavelengths along each path is the same or differs by one or more whole wavelengths, interference is _____
 [constructive] [destructive]

and when the number of wavelengths differ by a half wavelength (or odd multiples of a half wavelength), interference is _____

[constructive] [destructive].

It's nice how knowing some physics really changes the way we see things!

Concepts in Electron Correlation Alex C. Hewson, Veljko Zlatić, 2012-12-06 The NATO sponsored Advanced Research Workshop on Concepts in Electron Correlation took place on the Croatian island of Hvar during the period from the 29th of September to the 3rd of October 2002 The topic of electron correlation is a fundamental one in the field of condensed matter and one that is being very actively studied both experimentally and theoretically at the present time The manifestations of electron correlation are diverse and play an important role in systems ranging from high temperature superconductors heavy fermions manganite compounds with colossal magnetoresistance transition metal compounds with metal insulator transitions to mesoscopic systems and quantum dots The aim of the workshop was to provide an opportunity for a dialogue between experimentalists and theoreticians to assess the current state of understanding and to set an agenda for future work There was also a follow up workshop on the same topic where the presentations included more background and introductory material for younger researchers in the field The papers presented in these proceedings clearly demonstrate the diversity of current research on electron correlation They show that real progress is being made in characterising systems experimentally and in developing theoretical approaches for a quantitative comparison with experiment The more one learns however the more there is to understand and many of the contributions help to map out the territory which has yet to be explored We hope that the articles in this volume will be a stimulus for such future work
