

### Gravitational Physics (PHYS 3002): Gravitational acceleration

Note that Newton's law of gravity at the gravitational force depends not just on the masses and the distance, but also on the Earth's local gravity. This quantity is a force exerted by all nearby objects that surround the Earth, so this rather "not say" that the gravitational force is calculated in this PHOTON and not have to do with other influences that may exist within the gravitational force.

### Newton's law of universal gravitation

All masses in the universe are attracted to each other by a gravitational force. Since this force depends on the distance, something that two masses feel is dependent on the distance between them. This relationship is expressed by the equation:

$$F = G \frac{m_1 m_2}{r^2}$$

The gravitational force between two masses is always attractive (pulls them together).

The magnitude of the gravitational force  $F$  between two masses is directly proportional to the product of the masses  $m_1$  and  $m_2$  and inversely proportional to the square of the distance  $r$  between them. This relationship is expressed by the equation:

$$F \propto \frac{m_1 m_2}{r^2}$$

It is a constant of proportionality called the gravitational constant, equal to  $6.67 \times 10^{-11} \text{ N m}^2/\text{kg}^2$ . This constant is known as Newton's law of universal gravitation. It is also expressed by the following equation when you are working with a system:

1. The gravitational force  $F$  between two masses  $m_1$  and  $m_2$  is expressed by the equation:

$$F = G \frac{m_1 m_2}{r^2}$$

2. The magnitude of the gravitational force  $F$  between two masses  $m_1$  and  $m_2$  is expressed by the equation:

3. The magnitude of the gravitational force  $F$  between two masses  $m_1$  and  $m_2$  is expressed by the equation:

4. The magnitude of the gravitational force  $F$  between two masses  $m_1$  and  $m_2$  is expressed by the equation:
