

Work

The definition of work done may vary in real life and scientifically. **For Example**, We may consider studying, talking, singing, reading as work but it is not so in the case of science.

Examples of Scientific Work Done are:

- Moving a chair from one location to another
- Lifting a book from the shelf and placing it on a table
- Pushing a pebble lying on the ground.

In all these situations we are applying a force on an object which is then changing the state of rest or motion of the object.

So, we can conclude that work is done if and only if:

- A force is applied to an object.
- If the object is displaced from one point to another point.

These are also called '**Conditions of Work Done**'.

When you play a certain force ' F Newton' on an object and the object moves a distance of ' d meters' in the direction where you applied the force then, the amount of work done can be calculated as:

$$\begin{aligned}\text{Work done} &= \\ \text{Force} &\times \\ \text{Displacement} \\ W &= F \times d\end{aligned}$$

Definition of Work Done: Work is defined as the product of the force applied on an object and displacement caused due to the applied force in the direction of the force. Work is a scalar quantity. It has no direction of its own but a magnitude.
