The Power of Picture Books in Teaching Math and Science Lynn Columbia, 2017-05-12 This book's 50 plus lessons each based on a different picture book or story will help classroom teachers build a foundation for teaching math science and social studies concepts to their students Each lesson uses children's literature to make challenging abstract concepts relevant to children's lives inviting them to learn these concepts while responding to a story's illustrations theme characters and plot The lessons also demonstrate how teachers can use children's literature to meet national standards in math science and social studies Chapters 1 through 5 set the stage for using picture books discussing the effective imaginative integration of literature into the classroom Teachers will learn to create an environment that ensures that when children and books come together the experience is enjoyable and thought provoking Chapters 6 through 9 provide individual lessons by grade level with detailed activities based on specific books

Proceedings 2005 Symposium on Document Image Understanding Technology University of Maryland/UMIACS, 2005 *Tiger Check* Steven A. Fino, 2017-11 The fielding of automated flight controls and weapons systems in fighter aircraft from 1950 to 1980 challenged the significance ascribed to several of the pilots historical skillsets such as superb hand eye coordination required for aggressive stick and rudder maneuvering and perfect eyesight and crack marksmanship required for long range visual detection and destruction of the enemy Highly automated systems would proponents argued simplify the pilot's tasks while increasing his lethality in the air thereby opening fighter aviation to broader segments of the population However these new systems often required new unique skills which the pilots struggled to identify and develop Moreover the challenges that accompanied these technologies were not restricted to individual fighter cockpits but rather extended across the pilots tactical formations altering the social norms that had governed the fighter pilot profession since its establishment In the end the skills that made a fighter pilot great in 1980 bore little resemblance to those of even thirty years prior despite the precepts embedded within the myth of the fighter pilot As such this history illuminates the rich interaction between human and machine that often accompanies automation in the workplace It is broadly applicable to other enterprises confronting increased automation from remotely piloted aviation to Google cars It should appeal to those interested in the history of technology and automation as well as the general population of military aviation enthusiasts Provided by publisher

A timely analysis of the Columbia disaster and the organizational lessons that can be learned from it. Includes contributions from those involved in the Investigation Board report into the incident. Tackles vital issues such as the role of time pressures and goal conflict in decision making and the impediments for effective learning. Examines how organizational risk is managed and how technological and organizational complexities interact. Assesses how large medium and small organizations can and in fact must increase their resilience. Questions our eagerness to embrace new technologies yet reluctance to accept the risks of innovation. Offers a step by step understanding of the complex factors that led to disaster.

An Introduction to Modern Timekeeping and Time Transfer Parameswar Banerjee, Demetrios Matsakis, 2023-08-30 This book provides a comprehensive systematic description of modern timekeeping and its specializations. Introductory chapters discuss the concept of time and its definition then briefly look at pre Atomic Era timekeeping to set the stage for the introduction of the atomic clock. Subsequent chapters focus on concepts such as frequency stability and measurement uncertainty as well as computer network time synchronization protocols including Network Time Protocol NTP and Precise Time Protocol PTP. The book then delves into the nuts and bolts of the Global Navigation Satellite Systems GNSS Two Way Satellite Time and Frequency Transfer and Optical Time and Frequency Transfer. Timescale theory is then described as a way to combine clock data and the algorithms and procedures used to generate Coordinated Universal Time UTC are given. Finally there is a look at modern applications of timekeeping and time transfer. Featuring a glossary of all key terms this book is highly recommended for trained or incoming physicists engineers or mathematicians working for example in manufacturing or timing laboratories. Additionally it is suitable for use in introductory university courses dealing with the subject of timekeeping.

Seeing, second edition John P. Frisby, James V. Stone, 2010-04-02 An accessible yet rigorous and generously illustrated exploration of the computational approach to the study of biological vision. Seeing has puzzled scientists and philosophers for centuries and it continues to do so. This new edition of a classic text offers an accessible but rigorous introduction to the computational approach to understanding biological visual systems. The authors of Seeing taking as their premise David Marr's statement that to understand vision by studying only neurons is like trying to understand bird flight by studying only feathers make use of Marr's three different levels of analysis in the study of vision: the computational level, the algorithmic level, and the hardware implementation level. Each chapter applies this approach to a different topic in vision by examining the problems the visual system encounters in interpreting retinal images and the constraints available to solve these problems, the algorithms that can realize the solution, and the implementation of these algorithms in neurons. Seeing has been thoroughly updated for this edition and expanded to more than three times its original length. It is designed to lead the reader through the problems of vision from the common but mistaken idea that seeing consists just of making pictures in the brain to the minutiae of how neurons collectively encode

the visual features that underpin seeing Although it assumes no prior knowledge of the field some chapters present advanced material This makes it the only textbook suitable for both undergraduate and graduate students that takes a consistently computational perspective offering a firm conceptual basis for tackling the vast literature on vision It covers a wide range of topics including aftereffects the retina receptive fields object recognition brain maps Bayesian perception motion color and stereopsis MatLab code is available on the book s website which includes a simple demonstration of image convolution
