These researchers also examined how biological processes in the gut and other interconnected systems in the brain contribute to mental health and emotional regulation. They found that individuals with depression have altered levels of neurotransmitters like serotonin and dopamine, which are known to regulate mood. Additionally, they observed that chronic stress can lead to changes in brain structure, particularly in areas like the hippocampus, which is involved in memory and emotion. These findings suggest that mental health is not just a matter of the mind but is deeply intertwined with the body's biological systems. Understanding these connections can lead to more effective treatments that address both the psychological and physiological aspects of mental health.
