Sustainable Development of Algal Biofuels in the United States National Research Council, Division on Engineering and Physical Sciences, Board on Energy and Environmental Systems, Division on Earth and Life Studies, Board on Agriculture and Natural Resources, Committee on the Sustainable Development of Algal Biofuels, 2013-01-18 Biofuels made from algae are gaining attention as a domestic source of renewable fuel. However, with current technologies scaling up production of algal biofuels to meet even 5 percent of U.S. transportation fuel needs could create unsustainable demands for energy, water, and nutrient resources. Continued research and development could yield innovations to address these challenges, but determining if algal biofuel is a viable fuel alternative will involve comparing the environmental, economic, and social impacts of algal biofuel production and use to those associated with petroleum-based fuels and other fuel sources. Sustainable Development of Algal Biofuels was produced at the request of the U.S. Department of Energy.

Emerging Sustainable Technologies for Biofuel Production Maulin Shah, Deepanwita Deka, 2024-03-28 This book is presented on biofuel production, which includes different technologies developed and adopted to synthesize green renewable fuel alternatives for sustainable development. It also reflects different sources of biofuel, application of microbial community and microbial engineering to design fuel production, and the biosynthetic pathways of biofuel production by microbes. Although the expenses for the physical and chemical technologies for energy production and fossil fuel utilization to protect our environment are very high, these technologies are not eco-friendly and safe. Hence, the need of certain modern eco-friendly and cost-effective techniques to protect our environment is deeply apprehended by different workers of this field. These techniques involve some feasible technologies utilizing different biological agents like microbes to produce renewable energy. This book provides an outline of the science behind the multidisciplinary aspects of biofuel production. It summarizes a solid foundation in the fundamentals and progresses to practical applications in this field. It structures a stepwise route for a number of effective techniques to screen, select, identify, and utilize microbes for biofuel production and utilization. It also focuses on the theoretical groundworks of biofuel production, recent technologies related to microbial engineering like myco-engineering technologies, microbial metabolism, or modelling approaches to microbial physiology utilized for the same purpose. The techniques covered in this book ensure that scientists have the knowledge to practice effective biofuel production techniques themselves in a contaminated ecosystem in a sustainable way. Recent progress in the field of biofuels using microbial genetic engineering has larger perspectives in commercial scale production. However, its large scale production is still challenging; hence, to resolve this problem, it is essential to convert biomass into biofuels by developing novel technology to increase biofuel production to fulfil the current and future energy demand.

Microalgal Bioengineering Jorge Alberto Vieira Costa, Brian Gregory Mitchell, John Benemann, 2024-07-23 This book presents recent advances, challenges, and trends in modern microalgal biotechnology. It covers microalgae genetics,

bioreactors modeling massive scale and industrial cultivation and environmental social and economic aspects of microalgal biotechnology The book also explores the emerging knowledge about high value bioproducts from microalgae e g biofuels biosurfactants bioremediation bioplastics biopolymers pharmaceuticals antioxidants anti aging fatty acids polysaccharides and proteins feed and superfoods with microalgae The chapters will be written by prominent professors and researchers from the six inhabited continents of the world from academic to industrial sectors

Aquaculture: Ocean Blue Carbon

Meets UN-SDGS David Moore, Matthias Heilweck, Peter Petros, 2022-03-26 This book presents a solutions based approach to reducing and removing CO₂ from the atmosphere transforming it into solid crystalline CaCO₃ through the ability of marine organisms such as molluscs crustacea corals and coccolithophore algae The overwhelming advantage of this approach is that it promises enhanced climate mitigation in comparison to planting forests industrial engineering carbon capture and storage process It also provides a sustainable food resource Furthermore it would improve the ocean s biodiversity at the same time as the excess atmospheric CO₂ released by our use of fossil fuels is returned to the place it belongs as a present day fossil safely out of the atmosphere to the distant future If the level of finance and global effort that are readily foreseen for forest management and flue gas treatments were applied to expansion of global shellfish cultivation curative amounts of carbon dioxide could be permanently removed from the atmosphere within a few decades The concept presented in this book could have a profound influence on the life of the planet
