Empirical Modeling and Data Analysis for Engineers and Applied Scientists Scott A. Pardo, 2016-07-19 This textbook teaches advanced undergraduate and first year graduate students in Engineering and Applied Sciences to gather and analyze empirical observations data in order to aid in making design decisions While science is about discovery the primary paradigm of engineering and applied science is design Scientists are in the discovery business and want in general to understand the natural world rather than to alter it In contrast engineers and applied scientists design products processes and solutions to problems That said statistics as a discipline is mostly oriented toward the discovery paradigm Young engineers come out of their degree programs having taken courses such as Statistics for Engineers and Scientists without any clear idea as to how

they can use statistical methods to help them design products or processes Many seem to think that statistics is only useful for demonstrating that a device or process actually does what it was designed to do Statistics courses emphasize creating predictive or classification models predicting nature or classifying individuals and statistics is often used to prove or disprove phenomena as opposed to aiding in the design of a product or process In industry however Chemical Engineers use designed experiments to optimize petroleum extraction Manufacturing Engineers use experimental data to optimize machine operation Industrial Engineers might use data to determine the optimal number of operators required in a manual assembly process This text teaches engineering and applied science students to incorporate empirical investigation into such design processes Much of the discussion in this book is about models not whether the models truly represent reality but whether they adequately represent reality with respect to the problems at hand many ideas focus on how to gather data in the most efficient way possible to construct adequate models Includes chapters on subjects not often seen together in a single text e g measurement systems mixture experiments logistic regression Taguchi methods simulation Techniques and concepts introduced present a wide variety of design situations familiar to engineers and applied scientists and inspire incorporation of experimentation and empirical investigation into the design process Software is integrally linked to statistical analyses with fully worked examples in each chapter fully worked using several packages SAS R JMP Minitab and MS Excel also including discussion questions at the end of each chapter The fundamental learning objective of this textbook is for the reader to understand how experimental data can be used to make design decisions and to be familiar with the most common types of experimental designs and analysis methods *The British National Bibliography* Arthur James Wells,2000 **15**
