Causality, Correlation And Artificial Intelligence For Rational Decision Making Tshilidzi Marwala, 2015-01-02 Causality has been a subject of study for a long time Often causality is confused with correlation Human intuition has evolved such that it has learned to identify causality through correlation In this book four main themes are considered and these are causality correlation artificial intelligence and decision making A correlation machine is defined and built using multi layer perceptron network principal component analysis Gaussian Mixture models genetic algorithms expectation maximization technique simulated annealing and particle swarm optimization Furthermore a causal machine is defined and built using multi layer perceptron radial basis function Bayesian statistics and Hybrid Monte Carlo methods Both these machines are used to build a Granger non linear causality model In addition the Neyman Rubin Pearl and Granger causal models are studied and are unified The automatic relevance determination is also applied to extend Granger causality framework to the non linear domain The concept of rational decision making is studied and the theory of flexibly bounded rationality is used to extend the theory of bounded rationality within the principle of the indivisibility of rationality The theory of the marginalization of irrationality for decision making is also introduced to deal with satisficing within irrational conditions The methods proposed are applied in biomedical engineering condition monitoring and for modelling interstate conflict

persistent lack of data limited resources and often complex climatic hydrologic and hydraulic conditions In this research a regional method is proposed for assessing flash flood susceptibility and for identifying debris flow predisposition at the watershed scale An indication of hazard is obtained from the flash flood susceptibility analysis and continually the vulnerability and an indication of flood risk at watershed scale was obtained Based on risk analyses the research follows the modelling steps for flood forecasting development Input precipitation is addressed in the environment of complex topography commonly found in mountainous tropical areas A distributed model a semi distributed model and a lumped model were all used to simulate the discharges of a tropical high mountain basin with a p ramo upper basin Performance analysis and diagnostics were carried out in order to identify the most appropriate model for the study area for flood early warning Finally the Weather Research and Forecasting WRF model was used to explore the added value of numerical weather models for flood early warning in a p ramo area
